Secondary Express Server

Introducing DIMETRA Server redundancy for greater reliability of your system.

SmartPTT Express now supports Secondary Express Server, an alternate/redundant component of the DIMETRA Express solution. When the Primary Express Server is disabled or fails to work, Secondary Express Server starts managing the radio system infrastructure. Also, it opens its dispatch, AIS, SDTS, and other interfaces for third party applications.

SmartPTT Express supports automatic switchover between Primary and Secondary Express Server. Switchover takes approximately 2 minutes. When the switching is complete, all previous services are enabled and operate normally. This includes Voice Dispatch, Emergency and Selected Radio Commands, Voice Recording, GPS Location, and Text Messaging.

Secondary Express Server is a paid functionality in SmartPTT Express. To unlock it, you need to purchase a corresponding license from Elcomplus, Inc.
