SmartPTT Radioserver Configurator

Settings

In this tab you can configure the general settings of SmartPTT Radioserver:

- Radioserver,
- Licenses,
- Radio network services,
- Add-on Modules,
- Profiles,
- Subscriber groups,
- Metadata.

Radioserver

To set up the radioserver, click **Radio Server** in the left list of the SmartPTT Radioserver Configurator window. At that, the **Radio Server** window opens.

SmartPTT Server Configuration - C:\Program Files (x8)	6)\SmartPTT\Server\RadioService	.exe.config
Settings Networks Client List Rules Activity Log	Export/Import Settings Statistics	
Radio Server	Radio Server	
adio Network Services	Server Role	Primary
	Name	Radioserver
	Interface	Port
	Any 🔻	8888 🚔
	Authentication	
	No	
	VoIP Listen Port	18500
	Block option	Radio Disable 👻
	Limit Radios to Service	
	Enabled	Example: 1-99,150
	Allowed Radio Numbers	
	Process priority	Above normal
	Language	English

- Server Role: Sets the radioserver role: *Primary* or *Redundant*. Primary radioserver can have only one redundant radioserver and vise versa. To configure the redundant radioserver settings, see the <u>Redundant Radio</u> <u>Server</u> section.
- Name: Radioserver alias. You cannot type more than 20 characters into this field.
- Interface and Port: Radioserver IP address, i.e. the IP address of the PC where the radioserver is installed.
 Default port is 8888.

Note: If the specified port is occupied, you will see the warning icon **O** next to the input field. Hover the mouse over the icon to see where the port is being used.

• Authentication: Authentication parameters required for connection to the radioserver. Select *No* to set anonymous authentication. Select *Windows* to set Windows authentication.

Note: If *Windows* is selected, to connect, the dispatcher must use the user name and password of the account where the radioserver service was started.

- VoIP Listen Port: Number of a UDP port for receiving voice data from the dispatcher.
- Block option: Allows selecting the way how to block a radio. When Radio Disable is applied, radioserver sends the Radio Disable command to block the radio. The Deny Channel option denies the subscriber radio to work on the given channel.

Note: The *Deny Channel* option is applicable only to IP Site Connect (direct IP connection) or NAI based configurations.

Note: When the **Block Radio** command is sent from one radio unit to another, the radio will be blocked, even if *Deny Channel* is selected.

- Limit Radios to Service: Allows to manage the number of radios allowed in the network. Here the user can specify which radios are to be controlled by the system and which are not.
 - **Enabled:** Select to make this functionality active.
 - o Allowed Radio Numbers: Enter ID's of the radios which are to be controlled by the system.

Warning! All the radios whose ID's were not specified will be ignored by SmartPTT system.

Process priority: Allows selecting the priority that the system associates with a process. By setting this parameter you can speed up or slow down SmartPTT performance. The highest possible priority is Real time. Use it wisely! It may cause malfunctioning of the whole system. We recommend to use the Normal priority.

• Language: Allows selecting languages of the user interface of the SmartPTT Radioserver Configurator application.

Redundant Radio Server

To set up the redundant radioserver, perform the following actions:

Click Radio Server in the left list of the SmartPTT Radioserver Configurator window. In the Radio Server
window in the Server Role field select *Redundant*. At that the Redundant Radio Server item appears in the
left list of the SmartPTT Radioserver Configurator window.

SmartPTT Server Configuration - C:\Program	Files (x86)\SmartPTT\Server\Rad	ioService.exe.config

Redundancy: The redundant server can be useful in case of the primary server breakdown. Switching between
the servers is made automatically. In the <u>Network Configuration</u> tab you can set up automatic radioserver
redundancy error notifications.

Attention! The redundant server is activated only on the condition that the last connection to the primary server was no later than 31 days ago.

- Primary server address (host:port): The primary radioserver IP address and port.
- **Connection timeout (s):** Time interval that starts ticking as soon as the primary server is down. If the primary server has not recovered within the specified time interval, the redundant server takes over. The least possible value is 20 seconds.
- **Synchronize with primary radio server:** Enabling/disabling the auto synchronization of the redundant server with the primary one.

Note: When Synchronize with primary server is selected, the Settings, Networks, Network Configuration and Rules tabs are unavailable for editing except for the following parameters: Server Role and Language (Settings > Radio Server), redundant radioserver settings (Settings > Redundant Radio Server) and alarm notification settings (Network Configuration > Radio Server).

• **Copy Settings:** Copies the primary radioserver settings to the redundant one.

Note: If **Synchronize with primary server** is selected, the primary radioserver settings will be copied in accordance with **Correspondence table**.

 Correspondence table: Table of value and parameter replacement rules. It is available for editing only if Synchronize with primary server is selected.

• Change Type: Data type to be changed: Value or Parameter.

• Value/Parameter: The numerical value or the parameter name to be changed on the redundant radioserver.

• Redundant Radio Server Value: The value assigned to the redundant server.

To replace a certain value of all primary server parameters and add it to Correspondence table, click Add Value.

In Correspondence table in the Value/Parameter field enter the value to be replaced and in the Redundant

Radio Server Value field enter the replacing value.

To replace a certain parameter for the redundant server and add it to Correspondence table, click Add

Parameter. At that the Parameter Overriding window opens.

To edit a certain value or parameter in **Correspondence table**, double-click the required table row and make necessary changes.

To delete a value or parameter from **Correspondence table**, click the required value or parameter and click **Delete**.

To change a certain parameter value for the redundant server, perform the following actions in the Parameter

Overriding window:

Parameter Overriding	
Settings Networks Radio Server Radio Network Services Radio Network Services SMS Gateway Modem Settings Nodem Settings File Receive Add-on Modules Indoor Tracking Vent Log Settings Automatic Database Backup Phone Calls Incoming Calls Outgoing Calls Outgoing Calls Outgoing Calls Settings Nonitoring Settings Nutomatic Database Backup Monitoring Settings Automatic Database Backup Monitoring Settings NMP Service SNMP Service Metadata Automatic Database Backup	Parameter Name Value Redundant radio server Add

Language	

3. In the **Value** area either enter the value, select it in the drop-down list or select/unselect the checkbox.

- 4. To add the changed parameter to Correspondence table, click Add.
- 5. Having added all the required parameters click **Finish**.

Attention! You must always override the *Peer ID* parameter for the following network topologies: NAI IP Site Connect, NAI Capacity Plus and NAI Linked Capacity Plus. The primary and redundant servers must have different *Peer ID*s in the mentioned topologies.

How to Set up the Redundancy in SmartPTT Radioserver Configurator and SmartPTT Dispatcher.

To make the redundant server work correctly, perform the following actions:

- Take two radioservers and define their roles: **Redundant** or **Primary**. In the settings of the redundant server enter the IP address of the primary radioserver. A primary server can be backed up only with one redundant server. If needed, configure the synchronization of the redundant server with the primary one.
- 2. Make sure that both radioservers are up and running.
- 3. Add both radioservers into the dispatch console (Settings > Radioservers). Make them both active.
- 4. Check that you can see both radioservers online in the **Radio Fleet** panel of SmartPTT Dispatcher.

Licenses

In the Licenses menu you can see the services which are available to you in the SmartPTT software and install

a new license if needed.

tings Networks Client List Rules Activity	Log Export/Import Settings Statis	tics		
Radio Server	Licenses Licensed to: SmartPTT Customer Na License key ID: A0A0A0A0 Contacts: Address: Support expiration date: 10/1/2016	me

Availability of the services is regulated by the license file. It contains licenses—permissions to use the particular number of particular services. They'll be Those licenses are being called here as services.

At the fresh start the SmartPTT software generates demo license file which works for a small period of time. You cannot extent its activity period and you should obtain a regular license file.

Regular license file binds to the hardware of the primary radioserver PC or redundant radioserver PC. Hardware ID (HID) is required for the binding.

To obtain hardware ID via SmartPTT Radioserver Configurator:

1. Run SmartPTT Radioserver Configurator.

- 2. In the **Settings** tab click **Licenses**.
- 3. Click the **Collect** button in the **Activation** area of the **Licenses** window. The code which appears in the **Hardware ID** field is the hardware ID.

		Activation Hardware ID		
Click to collect HID	ł	Collect Copy		l

4. Click **Copy** to copy the hardware ID to the clipboard.

Activation Hardware ID 8610F84B-BE08E423-B0293BCF-6508CBF5-91242699	
Collect Copy •	Click to copy HID to the clipboard

To obtain hardware ID without SmartPTT Radioserver Configurator, please, refer to the <u>following article</u> on the

SmartPTT Technical Support Center website.

When you get the license file, you should install it. To do this:

- 1. Run SmartPTT Radioserver Configurator.
- 2. In the Settings tab click Licenses.
- 3. Click the **Change License** button.

Change License	_ Click to install
	the license file

4. Open the received license file. The License Installation window will appear.

License Installation

You cannot update or upgrade to the SmartPTT software released later of the expiration date of annual support.

Nevertheless, your current software will continue to operate without any limitations until the licensed services are not expired. You could also be provided with the limited technical support for the SmartPTT software.

To use the newest version of the SmartPTT software with all new features, please, renew the annual support.

Services

ARS

ARS or registration service provides information on the availability of radio subscribers in the radio network. To set up the registration service parameters, click **ARS** in the list in the left area of the SmartPTT Radioserver Configurator window. At that, a new window appears on the right.

SmartPTT Server Configuration - C:\Program	m Files (x86)\SmartPTT\Server\RadioService.exe.config	
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics	
Radio Server	ARS	
Radio Network Services	Active	
ARS GPS	Use Radio Check	
	Radio Inactivity Timeout, s 600	
Subscriber Blacklist	Global Minimum Request Interval, ms 1000	
	Automatic update of registration, h	

Active: Select to enable the service.

Use Radio Check: This setting defines the mechanism used for checking radio subscriber presence in the network. If selected, the system uses the Radio Check command. This option was implemented for radios that do not support ARS.

Radio Inactivity Timeout, s: Time period, after which the radio that did not display any activity becomes potentially absent. In this case the system includes this radio into a special presence check process.

Note: Radio activity includes the following events: GPS location, telemetry signal, text message or voice call.

Generally, a radio can be sent 5 presence check requests successively with a 30-second interval. This parameter is called Individual Minimum Check Interval and equals 30s; it can't be changed in SmartPTT Radioserver Configurator. This parameter sets the interval between presence check requests sent to one radio. Therefore, it can be increased depending on the number of radios to check. If the radio does not respond to the presence check requests and does not display any activity, it will acquire the Offline status after the 5th unsuccessful presence check request.

Global Minimum Request Interval, ms – sets the minimum interval between presence check requests sent to all inactive radios in all networks. Instead of sending presence check requests to all inactive radios at one time, the system puts them on a queue and sends one presence check request to one radio at a time with the interval set in the **Global Minimum Request Interval** field. This method allows us to eliminate the risk of sending too many

presence check requests at one time, thus removing traffic overload on the channel and spreading network load evenly.

Example

There are three radios active till 10:00:00 and 10:00:02 (see pic. below). Then, for the following 600s they do not display any activity. So, the radio activity timeout for Radios 1 and 2 runs out at 10:10:00 and for Radio 3 at 10:10:02. When it happens, the system creates a pool of inactive radios. The system puts the radios on a queue and starts sending presence check requests with the interval set in the **Global Minimum Request Interval** field. Radio 2 responds to the presence check request and is no longer regarded as potentially offline. Radios 1 and 3 do not respond to the presence check request and do not display any activity, so the system sends another request in 30s to each radio. After the 5th presence check request, the radios get the Offline status.

Automatic update of registration, h: If selected, the radio will send its ARS data to server at specified intervals. Note: We recommend to specify the <u>automatic registration update interval</u> larger than the <u>radio inactivity timeout</u> <u>interval</u>.

GPS

GPS or location service provides coordinates of radio subscribers with a GPS receiver so you can determine their current location.

To set up location service parameters, click **GPS** in the list in the left area of the SmartPTT Radioserver Configurator window. At that, the following window opens.

ttings Networks Client List Rules Activi	ty Log Export/Import Settings Statistic	s
Radio Server	GPS	
acenses ⊒ ∰ Radio Network Services	Active	
	Minimum location update interval, s	30
	Minimum Request Interval, s	1
Email Gateway SMS Gateway	Radio Inactivity Timeout, s	60
File Receive ⊕∰ Add-on Modules	Get Subscriber Location for Following G	iroups:
Profiles	Group Name	Time Interval, s On/Off

Active: Select to activate the location service.

Minimum location update interval, s: Minimum update time interval. If the time interval specified by the dispatcher is less than **Minimum location update interval**, the new value set by the dispatcher will be ignored, and subscriber location will be updated within **Minimum location update interval**.

Minimum Request Interval, s: The minimum interval between GPS requests sent to the radios within one network. The requests can be sent automatically or initiated by the dispatcher. This method allows us to eliminate the risk of sending too many GPS requests at one time, thus removing traffic overload on the channel and spreading network load evenly. **Radio Inactivity Timeout, s:** Time period, after which the radio that did not send GPS becomes potentially absent. In this case the radio receives a location update request.

system includes this radio into a special presence check process.

The **Get Subscriber Location for Following Groups** list allows you to specify location update time interval per subscriber group added in SmartPTT Radioserver Configurator under <u>Subscriber Groups</u>.

If Allow Dispatchers to Amend Location Update Time Interval is selected, dispatchers can reduce the location update time interval configured in the table above. However, if the time interval specified by the dispatcher is less than Minimum location update interval, the new value set by the dispatcher will be ignored, and subscriber location will be updated within Minimum location update interval. If Allow Dispatchers to Amend Location Update Time Interval is not selected, dispatchers won't be able to change the time interval for location update, and location will be updated within the time interval set in the table per each group.

Warning! If "Allow Dispatchers to Amend Location Update Time Interval" is not selected and there are no subscriber groups in the table, the dispatcher won't receive any subscriber location data.

TMS

TMS or text messaging service is used to exchange text messages between radio subscribers and SmartPTT Dispatcher. To set up the messaging service parameters, click **TMS** in the setting tree of the SmartPTT Radioserver Configurator window. At that, the **TMS** window opens. To enable the messaging service, select the **Active** check box.

SmartPTT Server Configuration - C:\Program	n Files (x86)\SmartPTT\Server\RadioService.exe.config
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics
Radio Server Licenses Radio Network Services ARS GPS GPS Composition Telemetry	TMS Active

Telemetry

The telemetry service is used for transmission and processing of telemetry signals between SmartPTT Dispatcher and radio subscribers. To set up the telemetry service parameters, click **Telemetry** in the list in the left area of the SmartPTT Radioserver Configurator window. At that, the Telemetry Service window opens. To enable the telemetry service, select the **Active** check box.

🎯 SmartPTT Server Configuration - C:\Program Files (xi	86)\SmartPTT\Server\RadioService.exe.config
Settings Networks Client List Rules Activity Log	Export/Import Settings Statistics
Radio Server Radio Network Services Radio Network Services Radio Network Services GPS Kaline Radio Network Services Radio Network Services	Telemetry Service

Subscriber Blacklist

Subscriber blacklist allows managing the number of available radio subscribers and operators in the network. To create a blacklist, first it is necessary to create subscriber groups. We will need these to form a blacklist. To add a subscriber group, click **Subscriber Groups** in the setting tree of SmartPTT Radioserver Configurator. At that, the **Subscriber Groups** window opens on the right.

ttings Networks Client	List Rules	Activity	Log	Export/Import Settings	Statistics		
Radio Server			Sub	scriber Groups			
·····¶ Licenses ⊡···@ Radio Network Ser ⊡··[] Add-on Modules	vices		Sam	nple List of Subscribers for	Group: 1,5,10-20		
				Add Remove			
Metadata			Gn	oup Name		Subscribers	
			Nev	w Group 1		1-12	
			Nev	w Group 2		13-24	
			Nev	w Group 3		25-36	

Group Name: Any name of a subscriber group.

Subscribers: The list of radio IDs that are to be included in the created group.

To configure blacklist parameters, click Subscriber Blacklist in the setting tree of SmartPTT Radioserver

Configurator. At that, the following window opens.

🛿 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config			
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics		
Radio Server ℜ Licenses Radio Network Services	Subscriber Blacklist		
ARS GPS 	Action for Selected Groups Allow Apply to Subscriber Groups		
Ele Peceive	Group Name	Active	
	New Group 1		
Profiles	New Group 2		
Subscriber Groups	New Group 3		
_	Blocking Retry Interval, s	60	
	Blocking Retries	10	

Active: Select to enable the subscriber blacklist service.

Note: Subscriber Blacklist allows not only blocking certain radios, but also creating the so-called "whitelist" of radios that are allowed in the radio network. In the latter case all other radios, that is not included in the whitelist, will be blocked.

To block certain groups of subscribers, choose **Deny** and select groups that are not permitted to communicate in MOTOTRBO network.

To allow certain groups of subscribers to communicate in MOTOTRBO network, that is to create a whitelist, select **Allow** and mark those groups that will be available in radio network when all other radios are blocked.

Blocking Retry Interval, sec: Sets a minimum time period for sending a command to block the radio added in the blacklist.

Blocking Retries: Number of retries to send the Block command to the radio before confirmation comes.

To save changes, click **Save** and then click **Restart** to restart SmartPTT Radioserver. If a radio is in the blacklist and MOTORBO control station is used (MOTOTRBO control station, Capacity Plus system), then the radio will be completely unavailable. When the radio is unavailable, some actions are still available: **Monitoring**, **Radio Check** and **Radio Unblocking**. The dispatcher can remove the block from the radio by sending the "Unblock" command. To enable the radio without dispatcher's help, just read the codeplug of the radio in MOTOTRBO Customer Programming Software (called MOTOTRBO CPS) and then write the settings to the codeplug.

To be able to process the Radio Disable command, the radio must have the **Radio Disable Decode** parameter selected in the codeplug. You can find it in MOTOTRBO CPS, in the **Signaling Systems** section. If **Radio Disable Decode** is not selected, the radio can't be blocked even if it is in the blacklist.

When direct IP connection is used (for example, IP Site Connect) in MOTOTRBO network, radio blocking allows to block the channel only. At that, "Channel Denied" is displayed on the radio screen. The radio can change the channel and resume its operation. To enable the blocked channel, the dispatcher should send the "Unblock" command to the radio. To enable the radio without dispatcher's help, delete the blocked channel and create the channel equal to the deleted one.

Email Gateway

Email gateway provides the ability to exchange digital messages between e-mail users and MOTOTRBO radio network subscribers. The following scheme displays how it is done.

To be able to exchange email messages between radio subscribers and email users you need:

- 1. Create and configure email account.
- 2. Configure the radioserver.

Create and Configure Email Account

First of all, create your email account, if you do not have one. This section describes how to do it as well as how to configure it properly.

- 1. Create your email account. You can use your corporate email server or any other server. In this example we are using *gmail.com*.
- 2. In the settings of the newly created email account specify all the necessary parameters.
- 3. In the settings of the email account in the Forwarding and POP/IMAP tab select the following items:
 - 1) Enable POP for all email (even mail that has already been downloaded).
 - 2) Enable IMAP.
 - 3) Save changes.

- 4. If you have an email client (for example, Microsoft Outlook), for the outgoing messages you need the following settings:
 - 1) Use plain text as message format.
 - 2) Use Unicode (UTF-8) for outgoing images (with Base64 encoder).

Configure SmartPTT Radioserver Settings

The radioserver configuration includes the following steps:

- 1. Configure email gateway (activate email gateway, choose the direction of text message sending).
- 2. Setup POP3/IMAP4 protocols for sending text messages.

Email Gateway Configuration

Select Email Gateway in SmartPTT Radioserver Configurator.

🎯 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config					
Settings Networks Client List Rules Activity Log Export/Import Settings Statistics					
Radio Server Licenses Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Subscriber Blacklist Radio Network Subscriber Blacklist Radio Network Reference Radio Network Services Radio Networ	E-mail Gateway Image: Active Image: Forward Messages to E-mail Sender Name 1mail Recipients example@gmail.com Image: Add Recipients example@gmail.com Image: Add Recipients example@gmail.com Image: Add Recipients Enable Direct Messages Delivery from Radio Network Image: Enable Direct Messages Delivery to Radio Network Receive protocol POP3 Image: Split Long Messages Image: Sender ID Image: Deferred actions Image: Ignore After Line				

Select the Active check box to enable the email gateway service.

Forward Messages to E-mail: Select to enable message forwarding from radio subscribers to the email addresses specified in the **Recipients** list.

Note: When a radio subscriber sends a text message to another radio subscriber, all email users whose emails are given in the **Recipients** list will receive 1 or 2 text messages. The first one with the confirmation that the message was sent and the second – with the confirmation on delivery.

Sender Name: Specify domain name, in the name of which all email messages will be sent (for example, *smartptt.com*).

Recipients: List of email addresses to receive forwarded text messages.

Enable Direct Message Delivery from Radio Network: Forwarding mail messages directly from radio subscribers.

Enable Direct Message Delivery to Radio Network: Forwarding mail messages directly to radio subscribers. **Receive protocol:** Select protocol for email message receiving (*POP3* or *IMAP4*).

Split Long Messages: If not selected, a long E-mail message, i.e. a message that contains more characters than allowed in one message in the radio network, addressed to a radio is trimmed to not exceed the limit (some information will be lost). If selected, the original message is split into several packages during transmission. Thus, the radio subscriber receives the message without information loss.

Sender ID: When selected, the received message contains the sender e-mail address.

Deferred actions: When selected, it allows to deliver an information to the offline subscriber. When subscriber becomes online, it will immediately receive it.

Ignore After Line: Ignore everything after a certain string in the received e-mail message.

Example:

The original e-mail message: Due to technical works on the PBX, the PI will have no telephony for the whole day. To turn off these notifications, open **Personal Settings**, click **Manage Alerts**. Clear check boxes next to unwanted notifications.

If you enter *To turn off* in the **Ignore After Line** field, the radio subscribers will receive the message: *Due to technical works on the PBX, the PI will have no telephony for the whole day.*

POP3 Protocol Configuration

In the Receive Protocol field, select POP3 and click Settings in the left setting tree.

SMTP server: Domain name of the SMTP server which is used for delivering outgoing email messages (for example, *smtp.gmail.com*).

Port: SMTP server port number.

Use SSL: Select this checkbox if you need secure connection to SMTP server.

Authentication: Select authentication method for SMTP server (*Anonymous* – connect anonymously, *Windows* – connect to the server under Windows user account, *Login/Password* – connect with Login/Password specified). Login: Email address or login required by the mail server.

Password: User password.

Send Test Message: Click the button to check server connection. In case of successful connection and correct settings, the mail user specified above will receive a test email message.

POP3 Server: Specify domain name of POP3 server which is used to deliver incoming e-mail messages.

Port: Enter POP3 server port number.

Enable SSL: Select this checkbox if you need a secure connection to POP3 server.

Authentication: Select authentication method for POP3 server.

Login: Enter email address or login required by mail server.

Password: User password.

Polling Delay: Polling interval for the mail server.

Check Connection: Click to check connection with the server. In case of successful connection, the pop-up window message shows the number of unread email messages in your email box. In case of connection failure, a window with connection error message opens.

IMAP4 Protocol Configuration

Select "IMAP4" in the drop-down list of Receive protocol and click Settings.

IMAP4 Server: Specify the domain name of IMAP4 server which is used for incoming email messages delivery.

Port: Enter IMAP4 server port number.

Enable SSL: Select this checkbox if you need secure connection to IMAP4 server.

Authentication: Select authentication method for IMAP4 server.

Login: Enter email address or login required by mail server.

Password: User password.

Polling Delay: Polling interval for the mail server.

Check Connection: Click the button to check connection with the server. In case of successful connection, the pop-up window shows the number of unread mail messages in your email. If connection is failed, connection error window opens.

Supported Message Formats

When sending an email message to radio subscribers, use the following format of the message.

: - prefix indicating that this message is addressed to a radio subscriber or talkgroup.

<ID|IP> – ID or IP address of the radio subscriber or subscriber group.

Space indicates the beginning of the message body.

Use the Split Long Messages option to guarantee that a message won't be cut.

Example:

- 1. The email message :12.0.0.77 Hello! or :77 Hello! received from the mail server will be forwarded to the radio subscriber with ID 77.
- The email message :225.0.0.1 Please, call to the station received from the mail server will be forwarded to the subscriber group with ID 1.

The email message *:12.0.0.80,12.0.0.81,12.0.0.82,12.0.0.50 Hello!* or *:9080,9081,9800,9050 Hello!* received from the mail server will be forwarded to the radio subscribers with corresponding IDs.

When sending a text message from a radio subscriber to an email user, use the following format.

: - prefix indicating that this message is addressed to an email user.

<email_address> - email address of the email user.

Space indicates the beginning of the message body.

Example:

- The message :email_address@example.com Hello! from a radio subscriber will be forwarded to the email user with the email address email_address@example.com.
- The message :email_address1@example.com,email_address2@example.com Hello! from a radio subscriber will be forwarded to the email users email_address1@example.com and email_address2@example.com.

Note: When **Forward Messages to E-mail** is enabled together with the options of receiving messages from radio network and from the email, all messages sent or received by email users will be duplicated to the specified email addresses.

SMS Gateway

SmartPTT Radioserver has an integrated SMS Gateway service, which allows establishing communication between radios and mobile phones There are 2 possible ways to communicate between each other:

- 1. A radio subscriber sends an SMS to a phone subscriber.
- 2. A phone subscriber sends an SMS to a radio subscriber.

To be able to send an SMS, it is necessary to do preliminary settings on both modem and SmartPTT Radioserver.

Configuring SmartPTT Radioserver and incoming messages

Select the SMS Gateway item in SmartPTT Radioserver Configurator.

SmartPTT Server Configuration - C:\Program Files (x)	86)\SmartPTT\Server\RadioService.exe.config
Radio Server Licenses Client List Rules Activity Log Radio Server Licenses Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Server Radio Serv	SMS Gateway Image: SMS sending Image: SMS sending Image: Allow SMS Delivery from Radios Image: Allow SMS Delivery to Radios Image: Allow SMS Delivery to Radios Image: SMS messages Image: Sender ID Image: Sender ID Image: Sender ID

Active: Select to enable SMS Gateway service.

Allow SMS Delivery from Radios: Select this option if you need to forward SMS directly from subscriber radios.

Allow SMS Delivery to Radios: Select this option if you need to forward SMS directly to subscriber radios.

Split Long Messages: If selected, a long message, i.e. a message that contains more characters than allowed in

one message in the radio network sent to a radio, will be split into several messages. If not selected, a long

message addressed to a radio is trimmed to not exceed the limit (some information will be lost).

Sender ID: If selected, the radio subscriber will see the phone number of the sender with the received SMS.

Deferred actions: If selected, it allows to deliver an information to the offline subscriber. When subscriber becomes online, it will immediately receive it.
Configuring a modem and outgoing messages

Warning! To enable modem settings, stop SmartPTT Radioserver.

💱 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Settings Networks Client List Rules Activity	/ Log Export/Import Settings Statistics	
SmartPTT Server Configuration - C:\Progra Settings Networks Client List Rules Activity Radio Server Licenses Licenses Radio Network Services Image: Construct and the services Image: Construct and the services Image: Construct and the services Image: Construct and the services Image: Construct and the service	m Files (x86)\SmartPTT\Server\RadioService Log Export/Import Settings Statistics SMS Gateway Settings Modem settings become enabled after stopping Port name: Speed: Data bits: Stop bits: Parity: Read timeout: Write timeout: Check Modem Use text mode SMS Center for outgoing messages Test Settings Phone Number Message	e.exe.config
	Send	

Port name: COM port number which modem is connected to. You can find the COM port number by opening modem properties in Windows Control Panel.

Speed: Data flow rate through COM port (in bits/sec).

Data bits: Number of data bits to transmit.

You can configure **Data Bits** to be 5, 6, 7, or 8. Data is transmitted as a series of five, six, seven, or eight bits (five and six bit data formats are used rarely for specialized communications equipment).

Stop bits: Number of bits used to indicate the end of a byte. You can configure **Stop Bits** to be *1*, *1.5*, or *2*. If **Stop Bits** is *1.5*, the stop bit is transferred for 150% of the normal time used to transfer one bit.

Both the computer and the peripheral device must be configured to transmit the same number of stop bits.

Parity: Method of detecting errors in transmission.

You can configure **Parity** to be *None*, *Odd* or *Even*.

If **Parity** is *None*, parity checking is not performed and the parity bit is not transmitted.

If **Parity** is *Odd*, the number of mark bits in the data is counted, and the parity bit is asserted or unasserted to obtain an odd number of mark bits.

If **Parity** is *Even*, the number of mark bits in the data is counted, and the parity bit is asserted or unasserted to obtain an even number of mark bits.

Read timeout: Number of milliseconds before a time-out occurs when a read operation does not finish.

Write timeout: Number of milliseconds before a time-out occurs when a write operation does not finish.

Check Modem: Modem operation test. If a modem is detected, you will see information regarding the type of

modem installed on your system. If there is no modem detected, you will see "Modem not found" message.

Check modem	
Check modem connection COM2: opened! Modem Response: Modem found. Manufacturer data: ATI Cinterion MC52i	
REVISION 01.201	
	Close

The next step is to check settings for outgoing messages and to send a test message.

SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config □ □ □ □ □ □		
Settings Networks Client List Rules Activity Log Export/Import Settings Statistics		
Radio Server Licenses Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Radio Network Services Subscriber Blacklist Radio Server Subscriber Blacklist Radio Server Radio Network Services Radio Network Services R	SMS Gateway Settings SMS Gateway Settings Modem settings become enabled after stopping the radioserver. Port name: COM1 Speed: Data bits: Stop bits: Parity: None Read timeout: Write timeout:	
	Use text mode SMS Center for outgoing messages +79876543210 Test Settings	
	Phone Number +70123456789 Message Type message	
	Ser	nd

Use text mode: Allows selecting Text or PDU mode for SMS sending.

There are two ways of sending and receiving SMS messages: in text mode (the check box selected) and in the protocol description unit (PDU) mode (the check box is not selected). The text mode (unavailable on some phones) is just an encoding of the bit stream represented by the PDU mode, and can be used only for English; PDU mode and Unicode are used for all languages. Unicode is the universal character encoding which provides the basis for the consistent encoding, representation and handling of text expressed in most of the world's writing systems.

SMS Center for outgoing messages: SMS message center number. If the number is registered on modem's SIM-card, there is no need to fill this field.

Running tests on SMS sending

Make sure SMS messages can be sent to recipients from SmartPTT Radioserver. Use **Test Settings** to do it. First, in the field **Phone Number** specify the phone number where you will send the test message. Second, enter the text of the message in the field **Message**. And then click **Send**.

If the message is successfully sent, you will get a confirmation notification.

Nodem Response
Message
ОК

When modem is selected and test message is successfully sent, save the changes and start the radioserver

Now you are ready to send SMS messages from the radio and to the radio.

To send an SMS from the mobile phone to the radio, the message forwarded to the modem number should comply with one of the following formats.

: - prefix indicating that this message is addressed to a radio subscriber or talkgroup.

<Radio/Talkgroup IP> - radio or talkgroup IP address of the recipient

<Radio ID> - radio ID of the recipient

Space indicates the beginning of the message body.

Use the **Split Long Messages** option to guarantee that a message won't be cut.

Example:

 When the radioserver gets the following message, it sends the message to subscriber 77 (or to talkgroup ID=2):

 To subscriber 77:

 :12.0.0.77 SMS text

 :77 SMS text

 To talkgroup 2:

 :225.0.0.2 SMS text

 To multiple subscribers simultaneously:

 :12.0.0.80,12.0.0.81,12.0.0.82,12.0.0.50 SMS text

 :9080,9081,9082,9050 SMS text

Note: When only ID is specified (with no IP address of the radio or talkgroup), SMS can be sent only to the subscriber with the specified ID. To send a group SMS, it is necessary to use a full talkgroup IP address.

To send an SMS from a radio to a mobile phone, the message should comply with the following format.

: - prefix indicating that this message is addressed to a mobile phone.

&phone number – mobile phone number of the SMS recipient (symbol "&" is used instead of "+" because there is no "+" symbol on the MOTOTRBO radios).

Space indicates the beginning of the message body.

Example:

On receiving the message :&71234567890 SMS text, the radioserver sends it to the mobile radio with the phone number +71234567890.

To several mobile subscribers simultaneously:

:&71234567890,&71234567890 SMS text

File Receive

File Receive service is an easy and useful tool, which allows sending files for almost all MOTOTRBO radios. This function is even more necessary in field communication characterized by the absence of the Internet connection and other channels to transmit data.

In version 2.0 SmartPTT File Transfer allows receiving files without the server application or base stations. The user needs to have only a radio connected to the PC via USB port and the client application SmartPTT File Transfer version 2.0.

Note: Not all networks support the new scheme of file transfer. It is possible for IP Site Connect only. For other network types use the old file transfer method, that is using control stations and server application SmartPTT File Transfer version 1.0 or 2.0.

To enable this functionality the following steps should be taken:

- 1. Configure SmartPTT Radioserver settings.
- 2. Configure the radio with the help of MOTOTRBO CPS.
- 3. Configure routing settings for file transfer on a remote computer.
- 4. Configure the client application SmartPTT File Transfer 2.0.

How to Configure SmartPTT Radioserver

To configure the settings, select the **File Receive** menu item in the left setting tree of SmartPTT Radioserver Configurator. At that, the **File Receive Service** window opens on the right.

Settings Networks Client List Rules Activity Log Export/Import Settings Statistics Radio Server File Receive Service File Receive Service File Receive Service	😵 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Radio Server File Receive Service	les Activity Log Export/Import Settings Statistics

Active: Enables the service.

Port: Port used by file receive service.

Received File Folder: Field to specify the folder name where received files are to be stored.

To apply the changes, save the new settings and restart the radioserver.

How to Configure Radio Settings in MOTOTRBO CPS

For the best file transfer rate a radio should be configured in the following way:

- 1. Open MOTOTRBO CPS and go to **General Settings** and configure the **TX Preamble Duration** parameter to be *60* ms.
- 2. Go to Network and configure the Max TX PDU Size parameter to be 500 byte.
- 3. Clear **Data Call Confirmed** for the channel where the files are to be transmitted.

How to Configure Routing Settings for File Transmission

To configure file transmission correctly, add information on the new route for file transmission in the routing table of the PC to which a radio is connected.

The routing table is configured via Windows command line. To open the command line, run file C:\\WINDOWS \system32\cmd.exe.

To add the file transmission route, use Windows command line:

route -p add 13.0.0.0 mask 255.0.0.0 192.168.X.X, where:

route is a command to add a route;

-p – the key for adding a route into the list of fixed routes;

add – adding the route;

13.0.0.0 - IP address of all radios available in the radio network;

mask 255.0.0.0 - network mask;

192.168.X.X - radio IP address.

Example:

To transmit data packets from the radio with IP address **192.168.10.1** (radio IP address can be found in the MOTOTRBO CPS application, **Network** menu item), the following command needs to be entered:

route -p add 13.0.0.0 mask 255.0.0.0 192.168.10.1

How to Configure SmartPTT File Transfer Settings

Download and install the latest version of the application SmartPTT File Transfer (http://www.smartptt.com/

demo_versija.html).

Launch the client application (Start > All Programs > SmartPTT File Transfer > SmartPTT File Transfer Client).

Note: For more information about the settings of SmartPTT File Transfer, please check SmartPTT File Transfer User Guide.

Add-on Modules

Tallysman

SmartPTT provides a more efficient radio monitoring that works in the Lone Worker mode. The option is compatible with MOTOTRBO DM/DP 3000 and 4000 series radios.

SmartPTT ensures the following features for the generic option board with the Tallysman Sprite[™] TW251 firmware:

- Mandown, i.e. activating the alarm signal if the radio position (its tilt) no longer corresponds to the parameters set for the option board in Tallysman Sprite Configurator.
- Heartbeat messages. Messages that provide information about subscriber presence in the radio network. If
 message delivery failed, SmartPTT Dispatcher is notified about the radio unavailability. The radio is also
 informed about radioserver unavailability (e.g., when the channel is busy).

Example of the option board configuration:

When the radio tilt changes, a signal is played on the radio. The signal stops after the radio is returned to its normal position. If not, an emergency alarm is sent to SmartPTT Radioserver. The emergency alarm LED on the radio can be turned off by a long press on the emergency alarm button (depends on the radio MOTOTRBO CPS settings).

For proper operation of the radios with the built-in option board with the Tallysman Sprite[™] TW251 firmware, do the following radio settings in MOTOTRBO CPS:

- enable option board on the selected channel by selecting the **Option Board** check box;
- enable the Emergency Alarm Indication option and select digital signaling system from the list in the Emergency System field. To set up a signaling system, go to Signaling Systems > Digital Emergency item.

💱 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Settings Networks Client List Rules Activity Log	Export/Import Settings Statistics	
Radio Server Radio Network Services Add-on Modules Add-on Modules Indoor Tracking Event Log D-100 Phone Calls	Tallysman Image: Active Heartbeat Message Port Response Delay, s 8	

Heartbeat Message Port: UDP port to receive messages about the radio presence in the network. This value must match **Host UDP Port** in the option board configurator (the **Heartbeat** item, the SmartPTT GOB Configurator application). Use the default value of *5000*.

Response Delay, s: The time period that passes before SmartPTT Radioserver sends heartbeat message confirmation to the radio. Set the value taking into consideration the network load. Otherwise, if the radio does not receive acknowledgment, the radio gets a signal about radioserver unavailability.

Indoor Tracking

Big organizations with huge premises require constant control over their employees' displacement inside buildings. For this purpose Indoor Tracking system was implemented. Indoor Tracking system allows getting data from special beacons and transmitting it to SmartPTT Dispatcher or any other client application using API. Contact our technical support (<u>http://support.smartptt.com/hc/en-us</u>) for SmartPTT Client API documentation.

Currently, SmartPTT system supports the following technologies and products:

- iBeacon technology: with the use of MOTOTRBO radios with the firmware version 2.6 and above and the beacons that support iBeacon technology,
- Blufi option boards (RF800) with special beacons (Connect-RTLS RF800), and
- Kilchherr option boards (K-TERM 44) with special beacons (K-TERM 70IC Beacon Transmitter).

Note: Indoor Tracking functionality requires the corresponding license. Connect Plus systems support Indoor Tracking based on the iBeacon technology only.

The following scheme shows how SmartPTT Radioserver gets subscriber location data.

iBeacon-based technology scheme: Each beacon installed is transmitting at an interval ranging from a fraction of a second to some minutes the data packages of the following format: *iBeacon prefix*—the title of the package, *UUID*—the unique identifier of the beacon, *Major*—the group parameter of the beacon, *Minor*—the individual parameter of the beacon in the group, *Tx power*—the strength of the signal, transmitting by the beacon. The radio with the preconfigured CPS settings (see <u>below</u>) receives the data packages from the beacons, which identifiers (UUID) are set in the CPS settings, and transmits them to SmartPTT Radioserver via repeater or control station.

Blufi scheme: The RF800 beacons operate in a continual Sleep -> Transmit -> Sleep -> Transmit mode. When the beacon awakes from its sleep cycle, it transmits its allocated code for the duration of the transmit phase and then returns to its sleep phase. The portable radios function in a similar fashion except they follow a Sleep -> Listen -> Sleep -> Listen mode. When a portable radio awakes from its sleep cycle, it listens for any transmitted beacon codes for the duration of its listen phase and then determines the current active beacon. If the new active beacon is different from the previous active beacon, a beacon update status message (a special TMS message) is sent via the radio network to SmartPTT Radioserver. For more information on Blufi beacons and option boards see the manufacturer's documentation on the products.

Note: Connect-RTLS RF800 option boards transmit data in special TMS messages, therefore it is necessary to have TMS enabled.

Kilchherr sheme: Each beacon installed is continually transmitting commands, like *Detect, Keep Alive, Lost,* which contain unique Beacon ID, set in K-Term CPS. When a radio gets closer to the beacon, the built-in option board receives Beacon ID and then transmits it with the Radio ID to SmartPTT Radioserver via repeater or control station. Further data processing can be handled by SmartPTT Dispatcher or any third party application, connected to the radioserver using API. For more information on Kilchherr beacons and option boards see the manufacturer's documentation on the products.

Warning! For the Kilchherr and BluFi option boards, in network systems with MNIS service enabled, make sure that the ID set in the option board settings (where data is to be sent) should match "MNIS Application ID". In network systems without MNIS service enabled, any ID can be set in the option board settings (where data is to be sent), however, it is necessary that "Data call confirmed" should be unselected in the radio settings. In networks based on control stations it is necessary that the ID set in the option board settings should match "Radio ID" set in the control station settings.

To use the **Indoor Tracking** feature based on the iBeacon technology, ensure that the MOTOTRBO radio meets the following requirements:

- the radio has the firmware version 2.6 and above,
- the radio supports Indoor-positioning, and
- the radio is <u>configured properly</u> in MOTOTRBO CPS.

To configure the MOTOTRBO radio for use of the **Indoor Tracking** feature based on the iBeacon technology, do the following:

1. Launch MOTOTRBO CPS with the 13.0 version or above and make the following settings:

Note: Below is a description of the Indoor settings only. The complete information on how to program the MOTOTRBO equipment step by step, see here.

• To ensure that the radio supports Indoor-positioning, click the radio title in the settings tree on the left and check in the **Device Information** tab if the **Indoor Location Tracking** field has the **Purchased** value.

 To activate GPS positioning, click General Settings in the settings tree on the left and in the Device Information tab select GPS.

• To turn on the **Indoor Location** menu display on the radio, click **Menu** in the settings tree on the left and in the **Menu** tab select **Indoor Location**.

• To activate Bluetooth on the radio, click **Network** in the settings tree on the left, click the **Bluetooth** tab and select **Enable**.

To activate and configure the Indoor Location mode, click Indoor Location in the settings tree on the left, select Indoor Location in the tab that opened and add the beacons by specifying the names and identifiers (UUID) of the beacons in the corresponding fields.

- 2. Set up Bluetooth in the radio to activate Indoor-positioning. For that, with use of radio menu buttons, perform the following commands:
 - Main Menu > Bluetooth > My Status > On.
 - Main Menu > Bluetooth > Indoor Location > Enabled.

To enable **Indoor Tracking** in SmartPTT Radioserver Configurator, select **Indoor Tracking** in **Add-on Modules** and select **Active**.

ettings Networks Client List Rules Activity Log	Export/Import Settings	Statistics
Radio Server	Indoor Tracking	
	Active	
⊨	Indoor source	Motorola 👻
<mark>∰ Indoor Tracking</mark> ⊕ [©] Event Log	Data Port	3100
⊕[iiii] Phone Calls ⊕& Bridging	Minimum RSSI level	-130
	Set list of allowed beacons	
Subscriber Groups		

Indoor source: The Indoor-positioning technology. Specify *Motorola*, if you use iBeacon technology, specify *BluFi* or *Kilchherr*, if you use the BluFi or Kilchherr products respectively.

Data Port: UDP port for listening to Beacon ID (applicable to Kilchherr beacons only).

Minimum RSSI level: The minimum strength of the signal, that radio receives from the beacon. SmartPTT Radioserver will not process the signals with the strength that is lower than the specified level (applicable to iBeacon technology only).

Set list of allowed beacons: You can specify the numbers of the beacons which data must be processed by SmartPTT Radioserver. If the option is not selected, the radioserver processes data from all the beacons. If you use *Motorola* source, specify the numbers of the beacons in the *Major.Minor* format, where the *Major* value is separated from the *Minor* value by a dot. *Major* stands for the group number of the beacons, *Minor* stands for the individual number of the beacon in the group. For the *BluFi* or *Kilchherr* source, specify the **Beacon ID**s.

Event Log

Event Log tracks all events from all dispatch systems connected to the radioserver. Events are registered in the event log even if SmartPTT Radioserver Configurator is closed.

To activate First activate the event log by checking off **Enable Event Logging**. To do it, select **Event Log** item in the setting tree in SmartPTT Radioserver Configurator.

ettings Networks Client List Rules Activity	Log Export/Import Settings Statistics		
Radio Server Licenses Radio Network Services Add-on Modules Tallysman	Event Log Active Creating Database Secure Name Log		
Event Log Settings Automatic Database Backup	Database Name: Radio Server		
Phone Calls Bridging Voice Notifications Orients Connection Profiles Subscriber Groups Metadata	Create New Database Authorization Mode: Windows NT Authorization Login: Password:		
	Check Connection Restoring Database Backup		
	Optimization To perform database optimization, please check the connection. Start		

Warning! To enable Event Log on the radioserver, the corresponding license should be available. Go to the Licenses section to acquire the necessary license.

To create a new database, type in the **Server Name** and the **Database Name** fields, and click **Create New Database**. If creation is successful, a message about successful database creation is displayed. If a database is not created, the cause of failure will be displayed at the bottom of the window.

Note: Database creation process at SmartPTT Radioserver is similar to the database creation process at SmartPTT Dispatcher.

Note: For the database server installed together with the radioserver enter the name using the following format: Name of computer\SQLExpress (for example, MYCOMP\SQLExpress).

Select Authorization Mode between the two:

Windows NT Authorization: The user who has logged into the Windows system, must be listed in the SQL server's list of users to make connection.

SQL Server Authorization: You must have the login name and password of the account with SQL server access. Click **Check Connection**. In case of successful authorization the message "The connection is established successfully!" is displayed. If authorization fails, the cause will be displayed at the bottom of the window. To restore the event log database from the backup, select the required database backup file in the **Path** field and click **Restore Database**.

Note: To set up the auto backup of the event log database, go to the <u>Automatic Database Backup</u> window. To optimize the event log database, click the **Start** button in the **Optimization** block. The optimization of the event log database accelerates the database query processing when getting a large amount of GPS data or events. For example, when building the **Radio Activity Reports**, **Subscriber Locations**, **Events for Period** and other reports in SmartPTT Dispatcher.

Note: The optimizing feature is applicable only to non-optimized event log databases created before the release of SmartPTT 9.0 and higher.

Before performing the optimization, ensure that the radioserver is stopped.

If the event log database is optimized, the **Optimization** block shows the corresponding message and the **Start** button is inactive.

Settings

To configure the radioserver event log select **Settings** in the **Event Log** menu.

SmartPTT Server Configuration - C:\Program Files (x8	36)\SmartPTT\Server\RadioService.exe.config
Settings Networks Client List Rules Activity Log Radio Server Licenses Radio Network Services Addon Modules Addon Modules Tallysman Indoor Tracking Event Log Settings Automatic Database Backup Phone Calls Voice Notifications Profiles Subscriber Groups Metadata	Export/Import Settings Event Log Settings Event log cleanup settings Do not clear event log Records retention period (days) 100 Audio recording settings Record incoming calls Record outgoing calls Audio records folder C:\ProgramData\SmartPTT\RecordedCalls\Server Audio file extension Recording volume of outgoing Audio records cleanup settings Audio records cleanup settings Pixed sample rate (8 kHz) Audio records cleanup settings Audio records cleanup settings On not delete audio records Do not delete audio records

To access the settings you should select Active in the Event Log menu.

The following settings are available to you:

- Event log cleanup settings: Select the proper variant.
 - o **Do not clear event log:** Select to keep as much of events in the log as possible in the hard drive.
 - Records retention period (days): Select to enter the maximum number of the last days to be logged.

Note: The following settings are available if server is running. To run it, click Run or Restart in the lower tool bar.

- Audio recording settings: Select the proper variant.
 - o Record incoming calls: Select to record voice calls initiated by the subscriber.
 - Record outgoing calls: Select to record voice calls initiated by the dispatcher.
 - Audio records folder: Select the absolute path to the folder where recorded voice calls will be stored

- Audio file extension: Select the proper extension of the file. Choose between the *MP3* (the default extension), *OGG* and *WAV* extensions.
- Recording volume of outgoing calls: Select the volume of the recorded voice call. Set the value between 1 and 5.
- Fixed sample rate (8 kHz): Select to force the sample rate of the recorded voice calls (reduces size of the file).
- Audio records cleanup settings: Select the proper variant.
 - **Do not delete audio records:** Select to keep as much of recordings (audio files) as possible in the hard drive
 - o Records retention period (days): Select to enter the maximum number of days to be "voice-logged".

Automatic Database Backup

Backing up data on a regular basis helps to protect it from being erased in case of the server hardware or software failure. SmartPTT Radioserver Configurator allows user to back up the event log database automatically. In order to set up automatic backup schedule of the event log database, select **Automatic Database Backup** under **Event Log** in the setting tree of SmartPTT Radioserver Configurator.

🎯 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics	
Radio Server Licenses Radio Network Services Add-on Modules Tallysman Indoor Tracking Event Log Settings Automatic Database Backup Phone Calls Original Voice Notifications Clients Connection Monitoring Nonitoring Nonitoring Monitoring Metadata	Automatic Database Backup ✓ Active Backup Folder ✓ Backup Settings ④ Daily Interval (days) ● Daily Interval (days) ● Weekly ● Monthly Time: 9:00 ● Backup Period Start Date: 01.09.2016 ● No End Date	

Active: Select the check box to enable the ability to create current event log database backups in the automatic mode.

Backup Folder: Full path to the file for saving the database backup.

Backup Settings: Schedule for creating the current database backup:

- Daily: Every fixed day at the specified time (for example, every day, every third day at 9:00 a.m.).
- Weekly: Every fixed day of the week at the specified time (for example, every Monday, Wednesday and Friday at 11:00 p.m.).
- Monthly: Once a month on the fixed day of the selected month and at the specified time.

Time: Sets the time for database backup. This setting is common to all database backup intervals.

Backup Period: Allows you to set time period when automatic database backup is to be made according to the selected backup settings.

Note: The number of stored backup files in the same folder is limited to 3. Otherwise, when creating a new copy, the old files are deleted.

Note: The event log database recovery from the automatically created backup is performed manually in the <u>Event</u> Log window.

Phone Calls

Now it is possible to make a conference call between radio subscribers, dispatchers and telephone subscribers without enabling Telephone interconnect.

For this, do the following:

1. Define **Deaccess code**. Make sure that it matches the deaccess code specified in subscriber's radio settings.

🎯 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Settings Networks Client List Rules Activity L	og Export/Import Settings Statistics	
Radio Server Radio Server Licenses Radio Network Services Add-on Modules	Telephone Calls Access code *1	
Tallysman	Deaccess code #	
in	Radio ring timeout (s)	20

Help Cancel Finish

- Select Allow Calls to Telephone Subscribers;
- Define your radioserver IP address and RTP ports;
- Under the VoIP Gateway settings enter Dial Prefix for Outgoing Calls. This must match the same prefix set in the VoIP gateway.
- Specify the IP address of the VoIP gateway.

To save the changes, click Finish.

Additional features, which are applied to telephone calls over SIP protocol:

Radio ring timeout (s): Sets the time interval during which the radioserver waits for the radio subscriber to press

the PTT button.

Phone ring timeout (s): Sets the time interval during which the radioserver waits for the telephone subscriber to pick up the phone.

Phone call idle session timeout (s): Sets the time interval starting from the last time the radio subscriber presses the PTT button after which the telephone call will be automatically finished. This timeout must not exceed **TX Time-Out Timer** set in network settings in SmartPTT Radioserver Configurator and in repeater settings.

Conference call idle session timeout (s): Sets the time interval starting from the last time the conference call participant presses PTT button after which the conference call will be automatically finished.

Calls to be confirmed by radio subscriber: If enabled, when making a private call, group calls, All Call the telephone subscriber can hear the ring tone until the radio subscriber has pressed the PTT button. If these check boxes are not selected, the call will start immediately.

Radio subscribers' notifications: Sets notifications of radio subscribers of various events with a special tone: telephone calls, beginning and end of calls. The radio subscriber can also receive messages about errors.

Sound Volume Settings: Allows setting up sound volumes on a telephone and a radio during incoming or outgoing radio calls.

Telephone Interconnect

Telephone Interconnect service allows for communication between radio and telephone subscribers, and uses SIP and RTP protocols for signaling and voice data transmission. Voice data transmission is done in half-duplex mode. Switching between receiving and transmitting modes is carried out by voice interrupt initiated by a radio subscriber. There are several ways how to make the interconnection:

- A telephone subscriber makes a private call.
- A telephone subscriber makes a group call.
- A radio subscriber makes a call to a telephone subscriber.
- The dispatcher connects telephone and radio subscribers.
- The dispatcher connects a telephone subscriber and a talkgroup.

To use Telephone Interconnect service, configure the radioserver and VoIP gateway settings. Also, make sure that **Allow Telephone Interconnect** is enabled in the network slot parameters.

Configuring SmartPTT Radioserver

To configure SmartPTT Radioserver settings, go to SmartPTT Radioserver Configurator and select **Telephone** Interconnect as shown on the picture.

SmartPTT Server Configuration - C:\Program	n Files (x86)\SmartPTT\Server\RadioService.exe.config	
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics	
Radio Server Radio Network Services Add-on Modules Add-on Modules Indoor Tracking Event Log Phone Calls Comparison Telephone Interconnect	Telephone Interconnect Image: Colspan="2">Interface Radioserver Settings Interface 192.168.37.85 SIP port 5060

😥 🚟 Monitoring	Active Name Priority	
Subscriber Groups		
🗄 👘 Metadata	G711U 2	
	SPEEX 3	
	☑ G729 4	
	Permissions for Subscriber Groups: Active Group Name Incoming Calls Outgoing Calls	

Warning! To activate Telephone Interconnect, install the corresponding license. The license can be installed under Licenses.

Under **Radioserver Settings** specify the interface that will be used for sending and receiving commands and voice data when working with VoIP gateway.

SIP port: UDP or TCP port number to receive and send SIP data packets. The default value is 5060. Accordingly,

the specified port must be available for incoming and outgoing traffic.

Warning! If both SmartPTT Dispatcher and SmartPTT Radioserver are installed on one computer, their SIP ports must differ. For example, 5060 for the radioserver and 5061 for the dispatch console.

RTP ports: Each connection with a phone subscriber occupies two UDP ports (even port numbers are used by RTP protocol, and odd port numbers—by RTCP protocol). The specified port must be available for incoming and outgoing traffic. The default range of values is from *18650* to *18660*.

Warning! The address and the port of the VoIP gateway must be real (NAT is not supported). If both SmartPTT Dispatcher and SmartPTT Radioserver are installed on one computer, the port ranges set in and the RTP ports fields in SmartPTT Radioserver Configurator and SmartPTT Dispatcher must differ.

Transport: Allows selecting between TCP and UPD for SIP commands transmit.

In **Audio Codecs** you can enable or disable supported audio codecs, as well as change their priorities. Currently, there are 4 audio codecs: G711A, G711Q, SPEEX µ G729. When connecting to PBX the radioserver always uses the codec priorities list set in the PBX settings, while the PBX can ignore the priorities list set in the radioserver. That is why codecs used by the call initiator and the responder can be different.

Permissions for Subscriber Groups: In this section you can allow or forbid particular groups of radio subscribers to make or answer telephone calls. These groups of subscribers can be created under <u>Subscriber Groups</u>. If the **Active** check box is selected, and the table is empty, communication between radio and phone subscribers will be impossible.

Incoming Calls

In terms of SmartPTT system "incoming calls" are calls that are made from telephone subscribers to radio subscribers.

🧐 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config				
Settings Networks Client List Rules Activity	Log Export/Import Settings	Statistics		
Radio Server	Incoming Calls			
Radio Network Services	Private call mask	31T		
Tallysman	Group call mask	32NSST		
⊞¶ Event Log ⊟∏ Phone Calls	Incoming Calls Authentication	n		
Telephone Interconnect → Incoming Calls	Enabled			
🖶 🖓 Outgoing Calls	Realm	SmartPTT		
Voice Notifications	Usemame	usemame		
it 🚰 Monitoring	Password			
	Voice Menu Settings			
	Active			
	Radioserver call number	1		
	C:\Program Files (x86)\SmartPTT\Server\Sound\VoiceMenu.wz			
	Dial Extension Timeout, s	30		

A telephone subscriber can make two types of calls to radio subscribers.

- 1. Private call is a call when the radioserver calls to a radio subscriber. You can use **Private call mask** when making a private call.
- 2. Group call is a call when the radioserver calls to a talkgroup. You can use **Group call mask** to make a group call.

A mask is a regular expression. In the following table you can find all the symbols used in masks.

Symbols	Description
•	Used for any figure
[m-n]	Used for any figure in the interval from m to n
[a,b,c] or [abc]	Used for any figure from the list
Т	Used for any number of any figures

()	Used to unite regular expressions
{}	Used to include everything inside the brackets into the resulting number.
N	Used to denote network ID. N =0 when there is only one network. Can be used
	only in Group Call Mask .
S	Used to denote Slot ID (IP Site Connect) or Site ID (Linked Capacity Plus). Can
	be used only in Group Call Mask .

Example:

Let's review sample masks:

Private Call Mask: 31 or 31T

Group Call Mask: 32NSST

Then the dialed numbers will mean the following:

31403, i.e. 31 403: private call to subscriber with ID=403.

3200013, i.e. 32 0 00 13: wide group call to a talkgroup 13, which must be either unique for the radioserver, or located in the only network connected to the radioserver.

3210013, i.e. 32 1 00 13: wide group call to a talkgroup 13 located in network 1.

32112123, i.e. 32 1 12 123: local group call to a talkgroup 123 in network 1, on site 12.

The **S** symbol can be assigned different values and they depend on the network type. Below is the list of values that can be used for the **S** symbol:

- In the IP Site Connect network the S symbol can be assigned values 1 or 2 only, which correspond to the number of the IP Site Connect slot.
- In the Capacity Plus network the **S** symbol can have only one value: 0.
- In the Linked Capacity Plus network the S symbol can be assigned any value. S=0 stands for a wide group call. S=1, S=2, S=any other figure stand for a local group call specifying the LCP site number.

To make the All Call, use the following values:

- In the IP Site Connect network: **S**=1/2 and talkgroup ID=0.
- In the Capacity Plus and Linked Capacity Plus networks: **S**=0 and talkgroup ID=0.

Incoming Calls Authentication: Receiving an incoming call from a phone/softphone, the radioserver asks for the username and password corresponding to **Realm** in the described setting. The calling telephone subscriber must send back the username and password specified in this setting. To activate this ability, select **Enabled**.

Realm: Parameter used for the incoming telephone calls authentication.

Username: Username used for authentication.

Password: Password used for authentication. It should correspond to the specified realm.

Voice Menu Settings is used for setting up interactive voice response (IVR), i.e., a technology that allows SmartPTT system to interact with subscribers through the use of voice and DTMF tones input via keypad. If enabled and set up properly, the telephone subscriber can make a call to the radioserver and then to the required radio subscriber or talkgroup using the information heard in the voice menu file.

Radioserver call number: Number to call to the radioserver.

Voice Menu File: The audio file which will be played to the telephone subscriber. The sampling frequency of the audio file must be 8000 Hz.

Dial Extension Timeout, s: Period in seconds when the caller can dial the ID of the radio subscriber or talkgroup after listening to the voice menu file. If the caller has not dialed the ID before the time is out, the call will be dropped. Here is the list of steps to make a call using voice menu:

- 1. Dial your PBX number.
- 2. Dial the radioserver call number.
- 3. Dial * to turn on DTMF mode on the telephone (not obligatory, depends on the telephone parameters).
- 4. Dial the private or group call mask, and then the radio subscriber or talkgroup ID.
- 5. Dial #.

Example:

The radio subscriber ID: 120.

The PBX number: 9649.

The radioserver call number: 10.

The private call mask: 1.

The telephone subscriber will call: 9649 10 (*) 1 120 #.

Outgoing Calls

💱 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config		
Settings Networks Client List Rules Activity Log	Export/Import Settings Statistics

Voice Notifications Clients Connection Clients Connection Clients Connection Clients Connection Clients Connection Clients Cli	Dialing Rules TMS prefix A Outgoing Calls Authentication	
	Realm Username Password	SmartPTT1 SmartPTTuser
	Caller name for private calls	Example: Radio % Radio % Example: Group %
	Talk permit tone for phone	subscriber

Allow Calls to Default VoIP gateway: If enabled, radio subscriber calls to telephone subscribers are made automatically, using all the data given, such as IP address of the automatic exchange, **Source** and **Destination masks**, **Dialing Rules**. If the option is not selected, radio subscribers will need to enter the IP address and the full number of the telephone subscriber to make a call.

IP address: IP address of the automatic exchange.

SIP port: UDP or TCP port number to receive and send SIP data packets. The default value is *5060*. Accordingly, the specified port must be available for incoming and outgoing traffic.

Source mask: Must correspond to the source mask specified in the automatic exchange. It includes only figures, for example, 32%15, where % is the number of the radio subscriber.
Destination mask: Contains only figures, for example, 32%15, where % is the dialed telephone number. It is used to speed up dialing of the telephone number.

TMS prefix: Used for making a call to a telephone subscriber with the help of a text message sent from a radio. **TMS Prefix** can contain any available symbol on the radio keyboard. Figures following the specified prefix are regarded as the telephone subscriber's number.

Outgoing Calls Authentication: The setting includes parameters required for outgoing call authentication. If **Realm** is left blank, the specified user name and password are used in response to any authentication request from the called party. Otherwise, **Realm** is checked whether it corresponds to the requesting user name and password. If it matches, user name and password are sent. If not, the authentication is failed immediately.

Realm: If the value is set, SmartPTT Radioserver responds to authentication requests with the matching **Realm** value. If the value is not set, SmartPTT Radioserver sends user name and password given in response to any authentication request.

Username: User name used for authentication.

Password: Password used for authentication.

Caller name for private calls: Name of the radio subscriber that will be shown to the telephone subscriber. The percent symbol (%) will be replaced automatically by the radio number.

Caller name for group calls: Name of the talkgroup that will be shown to the telephone subscriber. The percent symbol (%) will be replaced automatically by the talkgroup number.

Talk permit tone for phone subscriber: If enabled, the phone subscriber will hear a special tone prompting to start speaking.

Bridging

SmartPTT bridging service allows joining various network systems into a single radio network. The bridging service is implemented in the scope of SmartPTT PLUS Radioserver and provides intelligent means of redirecting voice and data streams among different network systems.

To activate the Bridging service, click **Bridging** in the setting tree of SmartPTT Radioserver Configurator. In the opened window select the **Active** check box.

SmartPTT Server Configuration - C:\Program	n Files (x86)\SmartPTT\Server\RadioService.exe.config

🖶 📊 Metadata	

Multigroups

MultiGroups are used to organize dynamic routing of group calls between channels and different network systems. Routing of group calls can be global or limited to predefined channels. Configuration of MultiGroups does not require any bridging settings on SmartPTT Dispatcher, but **Bridging** must be enabled in SmartPTT Radioserver Configurator. If it is not activated, **MultiGroups** settings will be disabled. To create multigroups, go to **Bridging** and click **Multigroups**.

		Slot 1	

Talkgroup ID: The ID of the talkgroup whose calls are to be routed.

Subscribers IDs: Radio IDs of the radio subscribers who will be included in the multigroup.

Use all channels: Select this option if you want the group call to be routed globally.

How it works: If a multigroup is created for a talkgroup, and a group call is made to this talkgroup, SmartPTT starts to look for all the talkgroups with this ID. Then SmartPTT checks if these groups have radio subscribers that were defined in the multigroup settings. The group call will be routed only to the talkgroups that include at least one of these radio subscribers.

Use selected channels: Select this option if you want the group call to be routed within selected channels.

Note: When you add, change or delete a multigroup, it is not necessary to restart the radioserver. Click **Apply** to activate the multigroups.

Voice Notifications

The main purpose of the voice notification functionality is to warn talkgroups about the fire or other emergency and to manage evacuation. However, in normal mode voice notifications can be used to transmit ordinary announcements. To create a voice notification, select the **Voice Notifications** item in SmartPTT Radioserver Configurator. At that, the **Voice Notifications** window appears on the right. To enable the service, select the **Active** check box.

SmartPTT Server Configuration - C:\Program Files ()	x86)\SmartPTT\Server\RadioService.exe.config

Name: Name of the voice notification displayed in SmartPTT Dispatcher.

Sound File: Sound file in WAV format. Only monophonic files can be used as voice notifications.

Play Count: Specifies how many times the voice notification will be played on the channel. To be set in the range from *1* to *9999*.

Play Interval, s: Specifies the interval between the voice notification plays. To be set in the range from *5* to *216000*. Select channels of the hardware or/and virtual control stations in the **Channels** area (**All Call** or **Group Call**) that play the voice notification (after it was run in SmartPTT Dispatcher).

Note: Playing voice notification on the channel corresponds to an outgoing call of SmartPTT Radioserver and fully occupies the selected channel. Thus, each control station (hardware or virtual) can have only one call type to be used for playing voice notifications on the channel – an all call or a group call.

To delete the voice notification profile, right-click on the selected profile and click **Delete**.

Clients Connection

SmartPTT Radioserver Configurator allows to enable support for web serviceand third-party applications.

To configure the parameters common for the described above applications, click **Clients Connection** in the setting tree of SmartPTT Radioserver Configurator. In the **Clients Connection** window set the required parameters.

Settings Networks Client List Rules Activity	y Log Export/Import Settings Statistics
Radio Server Licenses Radio Network Services Add-on Modules Add-on Modules Tallysman Indoor Tracking Event Log Event Log Hone Calls Voice Notifications Clients Connection Web Service API Third-Party Applications Monitoring Nonitoring Metadata	Clients Connection Web Socket Server Interface Any Port 8191 Codec Broad Voice

Interface/Port: Radioserver IP address and port used for connection of the web, mobile and third-party applications to the radioserver.

Codec: Outgoing audio stream compression method.

Web Service

This service expands SmartPTT bounds, as it allows the dispatchers to do their job without the desktop SmartPTT

Dispatcher. Currently the web version provides the following functionality:

- Displaying radio subscribers on Google Maps,
- Sending TMS messages to and from radio subscribers,
- Getting ARS and GPS data, and
- Blocking and unblocking radios.

For more detailed information on web client configuration, refer to SmartPTT Web Client Installation and Configuration Guide.

To enable support for web client, select the Active check box in the Web Service window of SmartPTT Radioserver

Configurator.

Monitoring

The Monitoring service gives an outlook for the whole radio system in the real time. With the help of this service the dispatcher can see what is happening on the channels and get information on the state of the devices.

Warning! Monitoring service requires corresponding license to be installed at SmartPTT Radioserver. Licenses are installed under the Licenses section of SmartPTT Radioserver Configurator.

By default, the Monitoring service is not active. Select **Monitoring** in the setting tree in SmartPTT Radioserver Configurator and select **Active** to enable it. If the **Monitoring** service is not activated, the radioserver and its network won't be displayed on the **Monitoring** panel.

SmartPTT Server Configuration - C:\Program I	Files (x86)\SmartPTT\Ser	ver\RadioService.exe.config
Settings Networks Client List Network Configurat	ion Rules Activity Lo	g Export/Import Settings Statistics
Radio Server	Monitoring	
Licenses Licenses Licenses Licenses	Active	
Add-on Modules	Creating Monitoring Dat	tabase
	Server Name:	localhost\SQLExpress
⊕	Database Name:	Monitoring
Voice Notifications Original Clients Connection	[Create New Database
Monitoring	Authorization Mode:	Windows NT Authorization
Automatic Database Backup	Login:	
Profiles	Password:	
teredata	[Check Connection
	Restoring Database Ba	ickup
		Restore Database

To create a database for the monitoring purpose, type in the **Server Name** and **Database Name** fields, and click **Create New Database**. If creation is successful, a message about successful database creation is displayed. If the database is not created, the cause of the issue will be displayed at the bottom of the window.

Note: If the database server and SmartPTT Radioserver are installed on one computer, enter the name of the following format: Computer Name\SQLExpress (for example, MYCOMP\SQLExpress).

Select Authorization Mode between the two:

SQL Server Authorization: Login and Password must belong to the account with access to the SQL server.

Windows NT Authorization: The user, who has logged into the Windows system, must be listed in the SQL server user list to make connection.

Click **Check Connection**. In case of successful authorization the message "The connection is established successfully!" is displayed. If authorization fails, the reason will appear at the bottom of the window.

Note: The radioserver event log database, the Monitoring database and the Dispatcher event log database must be different.

To restore the monitoring database from the backup, select the required database backup file in the **Path** field and click **Restore Database**.

Note: To set up the auto backup of the monitoring database, go to the <u>Automatic Database Backup</u> window.

Settings

To configure automatic cleaning for the monitoring event log, go to the **Settings** section of the monitoring in SmartPTT Radioserver Configurator. At that, the following window appears.

Don't Truncate Event Log: If selected, monitoring event log is not cleared automatically.

Records retention period (days): If selected, the system will delete records older than the number of days set in

the field. By default, it is set to 100 days.

Automatic Database Backup

Backing up data on a regular basis helps to protect it from being erased in case of the server hardware or software failure. SmartPTT Radioserver Configurator allows user to back up the monitoring database automatically.

In order to set up automatic backup schedule of the monitoring database, select **Automatic Database Backup** under **Monitoring** in the setting tree of SmartPTT Radioserver Configurator.

Active: Select the check box to enable the ability to create current monitoring database backups in the automatic mode.

Backup folder: Full path to the file for saving the database backup.

Backup Settings: Schedule for creating the current database backup:

- Daily: Every fixed day at the specified time (for example, every day, every third day at 9:00 a.m.).
- Weekly: Every fixed day of the week at the specified time (for example, every Monday, Wednesday and Friday at 11:00 p.m.).
- Monthly: Once a month on the fixed day of the selected month and at the specified time.

Backup Period: Allows you to set time period when automatic database backup is to be made according to the selected backup settings.

Note: The number of stored backup files in the same folder is limited to 3. Otherwise, when creating a new copy, the old files are deleted.

Note: The monitoring database recovery from the automatically created backup is performed manually in the <u>Monitoring</u> window.

SNMP Service

SNMP service allows users to monitor network-attached devices such as repeaters, routers and uninterruptible power supplies (UPS).

Warning! To be able to get information about the state of a device, the user needs to have the corresponding license and an SNMP client application installed. Use versions 1 and 2 of SNMP client applications.

To obtain the license, go to SmartPTT Radioserver Configurator and open the **Licenses** section. Check if you have the license for SmartPTT SNMP service installed, and if not install it. For more information how to install licenses, check the <u>Licenses</u> section.

After you have obtained the license, enable SNMP service. To do that, select Add-on Modules > Monitoring >

SNMP Service. At that, the following window opens.

Note: Monitoring must be activated, otherwise you won't be able to enable SNMP Service.

ettings	Networks	Client List	Network Configuration	Rules	Activity	Log	Export/Import Settings Statistics
	Radio Serve Licenses Radio Netwo Add-on Mod Tallysma Indoor T Event Lu Phone C A Bridging Voice N Clients C Clients C Clients C Monitorin Clients C Setti Subscriber C	r ork Services ules in racking og àlls otifications connection ng ngs matic Datab <u>IP Service</u>	pase Backup	IMP Ser Active Iterface S Iterface	vice ettings [192.	168.37.4	85 V Port 161

Select the Active check box to enable the service. At that, the Interface Settings will become available.

Interface: The IP address of the radioserver.

Port: Port to listen to the data from the devices. By default, it is set to port 161.

Then, install SNMP client application. Configure its settings to contain the IP address of the radioserver to get information on the devices, and the **External Community** to get information on particular device parameters. The **External Community** can be found in SmartPTT Radioserver Configurator in the **Network Configuration** tab for each device.

SmartPTT Server Configuration -	- C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config

	External Community External Community	

Note: For more information how to get device parameters, read documentation or review the corresponding MIB file of the device.

Profiles

SmartPTT Radioserver Configurator allows creating permission profiles. The permission profiles are used to limit the operator's access to objects managed by SmartPTT Radioserver (control stations, talkgroups, services, IP Site Connect slots), and to provide additional opportunities in the organization of calls between dispatchers and radio subscribers.

To create a profile right-click **Profiles** in the setting tree of SmartPTT Radioserver Configurator and click **Add**.

At that, the following window opens.

ttings Networks Client List Network Config	guration Rules Activity Log Export/Import Settings Statistics	
Radio Server	Profile	
Radio Network Services Add-on Modules Profiles Subscriber Groups Metadata	Name Profile 1 Limit Radios to Service Image: Enabled Example: 1-99, 150 Allowed radio ID's 5-16, 2525 Expand All Collapse All Image: Private calls Image:	own

Name: The profile name.

The **Limit Radios to Service** area was designed to manage the number of radios allowed for this profile. Here the user can specify which radios are to be controlled by the profile and which are not.

To make this functionality active select **Enabled**. Then, in the **Allowed radio ID's** field, enter the ID's of the radios which are to be controlled by the profile.

Warning! All the radios whose ID's were not specified will be ignored by SmartPTT system.

This is how this scheme can be presented in the table:

Call From	Call To										
	Allowed group	Unallowed	Allowed radio	Unallowed	Dispatcher						
		group		radio							
Unallowed radio	Allowed	Not allowed	Allowed	Not allowed	Not allowed						
Allowed radio	Allowed	Not allowed	Allowed	Allowed	Allowed						
Dispatcher	Allowed	Not allowed	Allowed	Not allowed	Allowed						

Note: When adding allowed radios make sure that the same radios are specified in **Radioserver** > <u>Limit Radios to</u> <u>Service</u>. Otherwise, the radios not registered in both lists will be regarded as unallowed.

Upwards and downwards arrows are used for changing the order of head elements in the list. This order will be applied in SmartPTT Dispatcher, if this profile is used.

In the central list you can select all the elements which are to be controlled by the operator with this profile. If there are more than one operator on the same channel, set the unique **ID** for each operator. This will allow radio subscribers to make private calls to particular operators, dialing the specified ID.

Note. Operator can be assigned to the particular gateway of the network via ID. Therefore, it can be available to a fewer amount of talkgroups and subscribers.

To assign the ID to the profile in particular network:

- 1. Select the ID checkbox in particular network,
- 2. Double-click ID to edit it,
- 3. Enter the proper ID for the network.

Note. If ID is unselected, Network ID will be used to identify the operator or user. In addition, it will be assigned to the gateway, for which default radio ID is assigned. For more information see the configuration settings of DDMS or VRC gateways in you networks.

If several dispatchers have the same ID, they will hear each other's private calls, even if **Private calls** is not selected.

In Capacity Plus and Linked Capacity Plus configurations based on NAI protocol, when using control stations reserved for dispatcher private calls, a new parameter **Reserved Control Station** appears and the **ID** value matches the reserved control station **ID** automatically:

ettings Networks Client List Network Config	guration Rule	es Activity	Log	Export/Import Settings	Statistics
Networks Client List Network Config Radio Server Licenses Radio Network Services Add-on Modules Profiles Subscriber Groups Metadata	guration Rule Profile Name Limit Radi ♥ Enab Allowed r Expar	es Activity os to Service led adio ID's adio ID's - Linked Cap Reserved Co ID: 1 Private calls Listening to p Radio Netwo	Log Profile 1 Colla acity Plus Introl Stati	Export/Import Settings Exa 5-16, 252 apse All 1 - Slot 1 ion: Control Station 1 Ils between subscribers es	ample: 1-99, 150 25

Private calls: If enabled, it allows the dispatcher to initiate private calls to radio and telephone subscribers, and dispatchers.

Listening to private calls between subscribers: If enabled, it allows the dispatcher to hear private calls made from radio subscribers to other radio subscribers, dispatchers or telephone subscribers and vice versa, read their messages. This feature is available for networks with direct connection to repeater, e.g., IP Site Connect, Capacity Plus.

To allow the dispatcher to make an All Call or a group call, select the corresponding check box. If a group is selected, the dispatcher will hear all the calls made to this group.

To allow the dispatcher to use services like ARS, GPS, TMS, telemetry, select the corresponding check boxes

under Radio Network Services.

Save changes and restart the server to apply the new profile.

Note: To assign the created profile, open the dispatch console, Settings > Radioservers.

Subscriber Groups

Subscriber groups are used in many places, for example, to organize dynamic bridging of private calls, or to control telephone calls, or to set different location update intervals.

To add subscriber groups, click **Subscriber Groups** in the setting tree of SmartPTT Radioserver Configurator window. At that, **Subscriber Groups** window is displayed on the right.

tings Networks Client List Network Co	nfiguration Rules Activity Log Expo	ort/Import Settings Statistics								
Radio Server	Subscriber Groups									
····· ································	Sample List of Subscribers for Group	Sample List of Subscribers for Group: 1,5,10-20								
🤃 Profiles	Add Remove	Add								
Metadata	Group Name	Subscribers								
	New Group 1	1-10								
	New Group 2	11-20								
	New Group 3	21-30								

Group Name: Subscriber group name.

Subscribers: The list of radio IDs, which will be included in the created group.

Dynamic routing is configured in SmartPTT Dispatcher in the **Route** window.

Route	×
	Route Number
	8
Source Control Station	Route Type Destination Control Station
Automatically	Dynamic Automatically
Subscriber Group	
Engineers Group 1	
	OK Cancel

Select Dynamic in the Route Type list. Select the group in Subscriber Group list.

Note: Routing configuration is described in details in SmartPTT Dispatcher help (Bridging).

Metadata

To provide several dispatch consoles with one consistent list of subscribers it was decided to keep subscriber metadata, e.g., radio ID, radio subscriber name, and whether it supports GPS or not. This data appears in SmartPTT Dispatcher automatically as soon as the radioserver is up and running. This refers only to online radios. If a radio is offline and is added to the <u>Subscribers</u> list, it won't appear in SmartPTT Dispatcher.

To create the database for subscribers metadata, select Metadata in SmartPTT Radioserver Configurator:

Type in the **Server Name** and the **Database Name** fields, and click **Create New Database**. If creation is successful, a message about successful database creation is displayed. If a database is not created, the cause of failure will be displayed at the bottom of the window.

Note: For the database server installed together with the radioserver enter the name using the following format: *Name of computer\SQLExpress* (for example, *MYCOMP\SQLExpress*).

Select Authorization Mode between the two:

SQL Server Authorization: You must have the login name and password of the account with SQL server access.

Windows NT Authorization: The user who has logged into the Windows system, must be listed in the SQL

server's list of users to make connection.

Click **Check Connection**. In case of successful authorization the message "The connection is established successfully!" is displayed. If authorization fails, the cause will be displayed at the bottom of the window. To restore the database from the backup folder, select the required database backup file in **Restoring Database Backup** and click **Restore Database**.

Note: To set up the auto backup of the database, go to the <u>Automatic Database Backup</u> window.

Subscribers

To add subscriber metadata, select Subscribers:

Settings Networks Client List Rules Activity Log Export/Import Settings Statistics										
Radio Server Licenses Radio Network Services Add-on Modules Profiles Subscriber Groups Metadata Metadata Automatic Database Backup	Subscribers ID Input Forma IP address CAI + Radi Add	o ID Remove								
*8** ·		Cubacity Name	GPS							
g -	ID	Subscriber Name								
48v -	ID 12.0.0.1	Subscriber 1								
vgv -	ID 12.0.0.1 12.0.0.2	Subscriber 1 Subscriber 2								

ID Input Format: Allows you to select the radio ID format to use.

To add a radio to the list, click on **Add**. At that, a window for entering the radio ID opens up. The ID format depends on the selection in the **ID Input Format** section. In the **Subscriber Name** column enter the name of the added radio subscriber. In the **GPS** column select whether the radio supports GPS.

To delete the radio subscriber from the database, select it in the list and click on **Remove**.

Click **Save** to keep changes and restart the radioserver to see the newly added radio subscribers in the dispatch console.

Automatic Database Backup

Backing up data on a regular basis helps to protect it from being erased in case of the server hardware or software failure. SmartPTT Radioserver Configurator allows user to back up the metadata database automatically. In order to set up automatic backup schedule of the metadata, select **Automatic Database Backup** under **Metadata** in the setting tree of SmartPTT Radioserver Configurator.

SmartPTT Server Configuration - C:\Program	i Files (x86)\SmartPTT\Server\RadioService.exe.config
Settings Networks Client List Rules Activity	Log Export/Import Settings Statistics

	Monthly Day of month 1 Interval (month) 1 Time: 9:00
	Backup Period Start date: 06.10.2016 End date: 07.10.2016 No end date

Active: Select the check box to enable the ability to create database backups in the automatic mode.

Backup folder: Full path to the file for saving the database backup.

Backup Settings: Schedule for creating the current database backup:

- Daily: Every fixed day at the specified time (for example, every day, every third day at 9:00 a.m.).
- Weekly: Every fixed day of the week at the specified time (for example, every Monday, Wednesday and Friday at 11:00 p.m.).
- Monthly: Once a month on the fixed day of the selected month and at the specified time.

Backup Period: Allows you to set time period when automatic database backup is to be made according to the selected backup settings.

Note: The number of stored backup files in the same folder is limited to 3. Otherwise, when creating a new copy, the old files are deleted.

Networks

This section contains the description of configuration of control stations, MOTOTRBO topologies, SIP/RTP Interfaces and SmartPTT Radioservers.

- <u>Control stations</u>
- <u>Connect Plus</u>
- <u>NAI systems</u>
- Capacity Max
- SIP/RTP Interfaces
- SmartPTT Radioservers

Control Stations

In this section you can configure MOTOTRBO, analog and remote control stations, which are used as a gateway to radio network.

The MOTOTRBO control station is a mobile or portable MOTOTRBO radio station connected to the PC via USB and used as a gateway to radio network.

To set up the MOTOTRBO control station, right-click Control Stations in the Networks tab of SmartPTT

Radioserver Configurator, point to Add and click MOTOTRBO control station.

At that, a new setting window will appear.

Control Stations	MOTOTRBO Control Sta	ation
Control Station	Active	
	Name	Control Station 1
Connect Plus	Network ID	1
Capacity Max Networks	Control station IP address	192.168.10.1
SmartPTT Radioservers	Local interface	192.168.10.2
	Radio ID	16448250
	CAI Network	12
	CAI Network for Groups	225
	 Transmit Data Only Allow Telephone Interce GPS GPS ARS TMS Telemetry Service Analog Call Hangtime, ms Options GPS Transmission Mode 5 Tone Signaling System Encoder Telegram Num Voice Call Stun 	Port 4005 Port 4007 Port 4007 Port 4008 3000 🖨
	Unstun	PTT Dekey

Name: Control station name.

Network ID: Unique ID of the network.

Control station IP address: The IP address of the control station. The following address format and range are used: *(001-223).(000-255).(000-255).(001-253)*. Users can use any address except 127.x.x.x in the range from

1.x.x.x to 223.x.x.x. We recommend to use the address *192.168.10.1* by default, and in case of conflicts with other network interfaces you should select a different IP address.

Note: If two or more control stations are connected to the computer, one of the first three octets of the IP address must be unique for each control station.

Local interface: Local interface used for connection to the control station. A question mark at the beginning of the field means that the control station was not defined.

Radio ID: Unique radio station identifier used during communication with it. ID is to be set in the range from *1* to *16776415*. It is highly recommended to use *16448250* as ID.

CAI Network: CAI-Network identifier. To be set in the range from 1 to 126. Use the default value of 12.

CAI Network for Groups: The identifier of the group's CAI-Network. To be set in the range from 225 to 239. Use the default value of 225.

Transmit Data Only: If selected, the control station is used for data transmission only and is not displayed in SmartPTT Dispatcher.

Allow Telephone Interconnect: Allows you to enable voice calls to telephone subscribers.

GPS: Enables location service which provides coordinates of radio subscribers.

ARS: Enables registration service. Port *4005* is used as default. To register the radio in Capacity Max network, <u>start</u> <u>radioserver</u> and make a call. At that the radio will be registered in the network untill <u>Radio Inactivity Timeout</u> runs out and the radioserver is restarted.

TMS: Enables the service for exchanging text messages amid dispatchers and radio subscribers. Port *4007* is used by default

GPS Transmission Mode: Allows you to select the way how to transmit location updates: as data packet in multiple bursts or as a single CSBK (Control Signaling Block).

Note: The GPS Transmission Mode parameter is not applicable to the Capacity Plus systems.

GPS Transmission Mode	Advantages	Disadvantages
Data	 No need to configure additional settings for receiving GPS data except for the Capacity Max settings. In the Radio Management program for all Capacity Max channels select the Trunked Channel type. 	 Increased traffic load on a channel

Each solution has its own advantages and disadvantages:

CSBK	Low traffic load on a channel	Not all radios support CSBK commands
	Increased GPS transmission frequency	
	rate—once in 15 seconds	
Enhanced CSBK	Low traffic load on a channel	Not all radios support CSBK commands
	Increased GPS transmission frequency	
	rate—once in 7.5 seconds	

To transmit location data using CSBK or Enhanced CSBK, enable CSBK Data in radio settings.

	÷	Roar	n																		
	÷ 💼	Сара	acity Plus																		

Note: Enhanced CSBK can be used on Enhanced GPS channels only.

Analog Call Hangtime, ms: Virtual hangtime which is used for uniting analog calls into one. This was done to not overload the event log with too many records of analog calls. During this hangtime the channel is not reserved, any one can start transmitting.

Note: Although the control station can't be seen in the **Subscriber** panel, you can still find it in **Report Wizard** and **Radio Activity Report**.

5 Tone Signaling: Settings for 5 Tone signaling, also known as SelectV.

SelectV is used in the analog networks to arrange selective calls. As a result, the analog channel provides additional services other than all call. For example, group and private calls to the radio, blocking or unblocking the radio, checking the radio presence on the channel.

Note: The current version of SmartPTT Radioserver Configurator supports SelectV signaling for MOTOTRBO DM 46xx Series radios and DP 46xx, DP 48xx Series radios used as control stations.

Note: Make sure that control stations and radios operating on the analog channel are configured properly in MOTOTRBO CPS.

Selective call is based on subscriber addressing, i.e., on assigning IDs to subscribers. At the beginning of each session the sound signals of different frequencies are transmitted and received by the radio. Such signals are called telegrams. Each telegram contains from one to three sequences. Every sequence may include up to 12 tones. The telegram formed in this way may include the calling subscriber or talkgroup address, the radio ID, a status message or a command. The radio receives all signals, but handles only its telegrams, i.e., telegrams addressed to this radio.

Note: You can specify one or several identifiers (CAI + Radio ID or IP, MDC ID or 5 Tone ID) as a radio ID in SmartPTT Dispatcher in the Properties window. If the radio is used on the analog channel only, enter 5 Tone ID or MDC ID; the CAI and Radio ID or IP fields must be left empty.

System: 5 Tone signaling system. Parameters in this section allow you to match the outgoing command from SmartPTT Radioserver and the telegram number.

Note: When decoded, telegrams are verified if the telegram sequences correspond to one of the definitions, and then the command of this definition is applied. To configure the command definition, use MOTOTRBO CPS (**Decoder > Definitions**, the **Matching Encode Telegram** field).

To create a 5 Tone signaling system in SmartPTT Radioserver Configurator, click **Add**. The several signaling systems can be added for each control station. To change the control station signaling system, select the required value from the list.

To delete the selected 5 Tone signaling system, click **Delete**.

Voice Call: The telegram number conforming to the private or group voice calls.

Silent Interrogate: The telegram number which corresponds to the check command of the radio presence on the network without notifying the subscriber.

Stun: The telegram number which stands for sending the **Block** command to the radio.

Unstun: The telegram number which stands for sending the Unblock command to the radio.

Emergency Off: When the radio receives the telegram number while in an emergency mode, the radio terminates the emergency mode.

PTT Dekey: When the radio receives the telegram number, the radio stops the current call session.

When the telegram encoding parameters are set, it is required to assign the signaling system for the channel (see the <u>Channels</u> tab).

If necessary, the control station can be disabled from the connection list. To do this, clear the Active check box.

To delete the control station, right-click Control Stations entry in the setting tree of SmartPTT Radioserver

Configurator and click **Delete**.

Analog control station

Following user evaluations and to facilitate migration from analog technology to digital technology, SmartPTT has been complemented with support of analog control stations. Here you can find the configuration manual for the analog control station connected to the computer COM port via interface card. The interface card schematic is shown on the <u>website</u>.

To add an analog control station, right-click Control Stations in the Networks tab of SmartPTT Radioserver

Configurator, point to Add and click Analog control station.

At that a new setting window appears on the right.

Control Stations	Analog Control Station	
Control Station	Active	
Connect Plus	Name	Control Station 1
Capacity Max Networks	Network ID	1
SmartPTT Radioservers	Serial Number	
	Serial Port	-
	Switch Pin	CD (1) -
	Rx Pin	CTS (8) -
	Tx Pin	RTS (7) 🔻
	TX Time-Out Timer, s	60
	Analog Call Hangtime, ms	3000

Name: Control station name.

Network ID: Unique ID of the network.

Serial Number: The control station serial number.

Serial Port: The port to which the control station is connected.

Control station control signals:

- Switch Pin (incoming) is set to 1 (< -3.0V) when the control station is switched on.
- **Rx Pin** (incoming) is set to *1* when a signal carrier is registered on the channel.
- **Tx Pin** (outgoing) is set to *1* to switch to transmit mode.

Change the display of the control signals of the control station to the pins of the socket RS323 (see the DE-9 pin numbers in brackets), if it is different from the one that is specified.

Note: The default values of the control signals are universal and usually do not require any changes.

TX Time-Out Timer, s: Continuous radio transmission timeout. After this time the transmission is interrupted.

Analog Call Hangtime, ms: A virtual hangtime which is used for uniting analog calls into one. This was done to not overload the event log with too many records of analog calls. During this hangtime the channel is not reserved, any one can start transmitting.

In the Control Station Channels window add a channel and name it (otherwise the dispatcher displays 1:1).

Control Stations	Control Station Channels
Control Station 1	
Al Systems Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers	Add Remove Name Channel 1

Audio is configured in the same way as for the control stations MOTOTORBO.

Save the changes and restart the service.

Note: In SmartPTT Dispatcher the operation of the analog control station is the same as for MOTOTRBO control stations in analog mode without signaling.

Remote control station

A remote control station is a MOTOTRBO control station located anywhere else, and not connected to the radioserver PC by a USB cable. The control station is connected to a special gateway for remote control (RG-1000) which provides IP connection to the radioserver. The remote gateway supports MOTOTRBO control stations (DM series) on both digital and analog channels.

To add a remote control station, right-click Control Stations, point to Add and select Remote MOTOTRBO

Control Station. At that a new setting window appears on the right.

Channels	Activo		
Channels Talkgroups Audio	Acuve		
	Name	Remote control station 1	
	Network ID	1	
	Remote gateway IP address	192.168.10.1	XCMP port 30010
	Local interface	192.168.10.2 -	
	Radio ID	16448250	
	CAI Network	12	
	CAI Network for Groups	225	
	🔲 Transmit Data Only		
	Allow Telephone In	terconnect	
	GPS		
	ARS		Port 4005
	👿 TMS		Port 4007
	Telemetry Service		Port 4008
	Analog Call Hangtime, r	ns	3000 🚔
	Options GPS Transmission M	ode Data	•
	Local ports		
	XCMP	1024]
	Audio	1024]
	GPS	1025	
	TMS	1026]
	ARS	1027	
	Telemetry	1028]

Remote gateway IP address: The IP address of the remote gateway RG-1000 which provides control over the remote control station.

XCMP Port: The port of the remote gateway, it should match the XCMP port set in the settings of the remote gateway.

Local interface: The local interface used for connection to the remote gateway.

Set local ports: Local ports that can be used for connection to the gateway, if the default ports of the corresponding services are already in use. By default the system occupies local ports automatically, but you can define them manually.

Other parameters of the remote control station correspond to the parameters of an ordinary MOTOTRBO control station (see <u>here</u>).

How to Configure Control Station Channels

After adding a control station, configure its channels. To set up and edit control station channels, click **Channels** in the setting tree of SmartPTT Radioserver Configurator. At that, the following window is displayed.

To add a channel, click **Add**. At that, you will see a record of the added channel appear in the table.

Control Stations	Control Station Channels			
Channels 	Copy Paste			
Audio Connect Plus NAI Systems	Add Remove Zone Channel Signaling 🔗	2		
Capacity Max Networks	Channel 1 1 1 5 Tone - Sys1 🔗			
SmartPTT Radioservers	Channel 2 1 2 Auto	_		

Name: Channel alias visible to SmartPTT Dispatcher.

Zone: Serial number of a channel group. Information on the maximum possible number of zones and radio station channels is shown in the following table.

Model	Maximum number of	Maximum number of	Maximum total number
	zones	channels per zone	of channels
Mobile radio station	50	160	160
with display			
Mobile radio station	2	32	32
with seven segment			
display			

Channel: Channel sequence number.

Signaling: 5 Tone signaling system taken from the <u>MOTOTRBO Control Station</u> settings window. The field is available only if the MOTOTRBO control station has at least one 5 Tone signaling system.

When Auto is selected, the automatic detection of the channel type is set (analog, digital, IP Site Connect slot,

etc.). The detection take place when you connect the control station.

Note: If the channel type can't be determined automatically, you should specify the signaling system explicitly.

 $\overset{\checkmark}{=}$ – selected channel will be set at the control station, when you start the radioserver.

To remove a channel, click **Delete**. To edit channel name, zone or channel number, place the cursor on the corresponding field and make changes.

How to Configure Control Station Talkgroups

To set up and edit **Control Station Talkgroups**, click **Talkgroups** in the **Networks** tab of SmartPTT Radioserver Configuration. At that, the following window opens.

Control Stations Control Station 1 Channels Talkgroups Audio Connect Plus NAI Systems	Control Station Talkgroups	Control Station Talkgroups		
	Сору	Paste		
	All Call			
Capacity Max Networks	Add Remove 1	Down		
SmartPTT Radioservers	All Call			
	Group 1	1		
	Group 2	2		

To add a talkgroup, click **Add**. To add an all-call, click **All Call** The added talkgroups will also appear in the **Profiles** window. To change the order of groups in the list, use the **Up** and **Down** arrows. The order defined in the window will be used in SmartPTT Dispatcher.

Name: Talkgroup alias displayed by the control station.

ID: Talkgroup unique identifier used during communications. To be set in the range from 1 to 16776415.

Remove: Delete the selected talkgroup.

Copy: Copy added groups to the clipboard.

Paste: Paste copied groups from the clipboard.

To edit talkgroup name or ID, set the cursor on the corresponding field and make changes.

How to Configure Control Station Audio Settings

To select audio devices and set up VoIP parameters, click **Audio** in the **Networks** tab of SmartPTT Radioserver Configurator.

Control Stations	Audio Settings		
Control Station 1 Channels Talkgroups Audio Connect Plus NAI Systems Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers	Active Audio input DS : Default, 1 Input line Codec Format Audio output	Общая громкость ССІТТ u-Law 8000 Hz, 20 ms, 64 (86) kbps	•
	DS : Default, 1:L		•

The Active check box allows disabling calls for a control station if it is used to transmit data only.

Audio input: An audio device to which the control station audio output is connected.

Input line: Audio mixer line used for connections. The control station audio output can be connected to the line input of the audio device.

Codec: Outgoing audio stream compression method.

Format: Sampling frequency of an outgoing audio stream.

Example:

Specifications of the codec format 8000 Hz, 20 ms, 64 (86) kbps:

8000Hz is the sampling rate

 $\mathbf{20}\ \mathbf{ms}$ is the frame size

64 kbps is the voice data bit rate

86 kbps is a full bit rate (required network bandwidth)

Audio output: An audio device to which the control station audio input is connected.

Connect Plus

SmartPTT PLUS supports Connect Plus multi-site trunking system, which starting from version 8.5 can be used not only for ARS, TMS and GPS functionality, but also for voice communication between the dispatcher and radio subscribers.

Connect Plus network can include up to 15 repeaters (29 channels + 1 control channel) on each site. Each site must have at least one XRC Controller. It is the core of the Connect Plus network and its presence on each site is obligatory. The XRC Controller provides central call processing and real-time resource management for MOTOTRBO Connect Plus digital trunking systems. There can be two XRC Controllers per site if one of them serves as backup to the primary XRC. The secondary controller provides backup capability, but it does not increase the number of repeaters and calls that can be managed per site.

XRT Gateways are required for voice communication only. MOTOTRBO Connect Plus multi-site trunking network provides extended load capacity and provides digital communication to as many as 2,900 subscribers per site. When using Connect Plus network, SmartPTT Radioserver plays the role of a virtual repeater. The Connect Plus network configuration includes the following stages:

- 1. Adding new network and its basic configuration.
- 2. Setting up XRC Controller configurations.
- 3. Setting up talkgroups for group messages.
- 4. Setting up XRT Gateway parameters for voice communication.
- 5. Adding talk paths for voice calls.

How to Configure Connect Plus

Make sure you have the necessary license for the Connect Plus network, i.e. Connect Plus Voice Support and Connect Plus Data Support.

To configure Connect Plus settings, add new Connect Plus system: right-click **Connect Plus** in the **Networks** tab of SmartPTT Radioserver Configurator and click **Add**.

At that, the **Connect Plus** window opens.

Control Stations	Connect Plus	
Connect Plus 1	Active	
	Name	Connect Plus 1
NAI Systems	Network ID	1
Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers	Peer ID	1
	Radio ID	1
	Interface	Any
	UDP Start Port	19000

Active: Enables Connect Plus Network.

Name: Connect Plus network name.

Network ID: Unique ID of the Connect Plus network, which is used inside SmartPTT system. This is important if you have more than one Connect Plus network. Note that this ID is different from the Network ID defined in the XRC Controller codeplug.

Peer ID: Unique ID of the virtual repeater in the Connect Plus network. Make sure this ID is different from the repeater ID in the Connect Plus network.

Radio ID: The identifier of the radioserver. This is the identifier radio subscribers will see at receiving private calls and text messages from the dispatcher. If there are several dispatchers, you can create a profile for each operator (<u>Profiles</u>) and define a unique identifier for each operator. **Radio ID** set in this window must correspond to the **Console User ID** field in the XRT Gateway settings.

Isemame	public
assword	•••••
fax Talk Paths	10
Billing Enable	be
Network Wid	e All Call (NWAC) Enabled
Group Talk Pal	ths
Group ID	1001,1002
Private Talk Pa	aths
Console User	ID 100

Interface: IP address of the virtual repeater, i.e. SmartPTT Radioserver. Specify the IP address of the PC where the radioserver is installed.

UDP Start Port – this is the starting port number for local UDP ports that will be used by SmartPTT Radioserver for talk paths. It is recommended to use the default value of *19000*. If the created Connect Plus network should not transmit voice packets, this field can be ignored.

To delete the Connect Plus network, right-click the network you want to delete and click Delete.

XRC Controller

The XRC Controller is necessary for transmitting registration and de-registration, GPS data, text messages. The XRC Controller is also required for making private calls, because without it, radios will be regarded as offline, and the dispatcher won't be able to make private calls.

You can add only one XRC Controller per site. Right-click **XRC Controller** to add. At that, the following window opens:

Control Stations	XRC Controller	
Connect Plus	Active	
XRC Controllers XRC Controller XRT VoiceGateways Security Settings NAI Systems Capacity Max Networks	Name Controller Address I PN, TMS, GPS PN	XRC Controller remotehost
SIP/RTP Interfaces	Local Port	50005
	TMS	
	Controller Port	4007
	Local Port	50007
	GPS	
	Controller Port	4001
	Local Port	50001
	Monitoring	
	Controller Port	38000 🚖
	Local Port	38000 🗢
	Use NAT	

Name: XRC Controller name. This is used only in SmartPTT Radioserver Configurator.

Controller Address: IP address of the XRC Controller. Port is not required in this field.

In order to enable data services on the controller select PN, TMS, GPS.

Controller port: Port of XRC Controller for the corresponding service.

Local port: Port of the virtual repeater for the corresponding service.

Note: PN Controller Port should match the port of Presence Notification service set in XRC Controller.
To be able to review the XRC Controller on the **Monitoring** panel in SmartPTT Dispatcher, select **Monitoring** and specify **Controller port** and **Local port**. If the XRC Controller is in one local network with the radioserver, leave **Use NAT** unchecked. If the XRC Controller is outside the local network of the radioserver, select **Use NAT**.

Note: Make sure that general <u>Monitoring</u> is active.

In order to send group text messages, add talkgroups. Click **Talkgroups** under **XRC Controller**. At that, the following window opens:

Control Stations	Control Station Talkgroups	
Connect Plus 1	Сору	Paste
	All Call	
XRT VoiceGateways Security Settings	Add Remove	👚 Up 🛛 🐺 Down
NAI Systems	Name	ID
SIP/RTP Interfaces	Group 1	1
SmartPTT Radioservers	Group 2	2

XRT Gateway

The XRT Gateway allows making voice calls and monitor call events in the Connect Plus system. You can have maximum 5 XRT Gateways working in one network.

Note: To support private voice communication, it is necessary to have an XRC Controller. Otherwise, radio subscribers will be regarded as offline, and private calls will be impossible.

To add the gateway, right-click **XRT VoiceGateways** and click **Add**. At that, the following window opens.

Control Stations	XRT Gateway		
Connect Plus	Active		
XRC Controllers	Name	XRT Gateway	
Talkgroups	Gateway Address:Port	remotehost:10001	
Talk Paths	Pool IDs	16000001-16000100	
NAI Systems Capacity Max Networks	Usemame	public	
SmartPTT Radioservers	Password	password1	
	TX Time-Out Timer, s		60 🚔
	Group Call Hang Time, ms		4000 🚔
	Private Call Hang Time, ms		6000 🚖
	Emergency Call Hang Time	e, ms	8000

Name: XRT Gateway name, which is displayed only in SmartPTT Radioserver Configurator.

Gateway Address:Port: IP address and port of the XRT Gateway.

Pool IDs: It is recommended to use default values. The values must correspond to the range of IDs set in the XRT Gateway settings (**Pool ID**).

Username and Password: Used for authentication with the gateway and must equal the corresponding values in

the XRT Gateway settings:

Username	public
Password	•••••
Max Talk Paths	10
Billing Enable	be
Network Wid	e All Call (NWAC) Enabled
Group Talk Pal	the
Cours ID	4004 4000
Group ID	1001,1002
Private Talk Pa	oths
Console User	ID 100

TX Time-Out Timer, s: Time period during which the radio can transmit without interruptions. After this time is over, the transmission is interrupted.

Group Call Hang Time, ms: Time during which the channel is reserved for a group call after the end of transmission. During the timeout, only the participants of the talkgroup can transmit. This parameter should match the same parameter set in the XRC Controller.

Private Call Hang Time, ms: Time during which the channel is reserved for a private call after the end of transmission. During the timeout, only the participants of the private call can transmit. This parameter should match the same parameter set in the XRC Controller.

Emergency Call Hang Time, ms: Time during which the channel is reserved for an emergency call after the end of transmission. During the timeout only the participants of the talkgroup can transmit. This parameter should match the same parameter set in the XRC Controller.

The next step is to add talk paths. They are necessary for voice communication. For each talkgroup or/and dispatcher add a talk path. This can be done in the **Talk Paths** window. Group IDs should match the IDs set in the **Group ID** field in the XRT Gateway settings (see above). If the **Group ID** field is empty in the XRT Gateway settings, the user should have permission for any Group Talk Path that it validly registers with the XRT 9000. Dispatcher ID should match the ID set in the **Console User ID** in the XRT Gateway settings (see above).

Note: When adding talk paths make sure that talk paths with the same identifiers are specified in the XRT Gateway settings.

Control Stations

Control stations provide voice communication like the XRT Gateway. You can use control stations instead of the XRT Gateway or together with it to increase the number of talkpaths. One control station can be reserved for one group call or dispatcher call only.

Note: To use control stations, you need a special license.

To add a control station right-click on **Control Stations** in the **Networks** tab of SmartPTT Radioserver Configurator and then click **Add** > **MOTOTRBO control station**. You can also add a remote control station, for more information about a remote control station see <u>this article</u>.

Control Stations	Connect Plus Cor	ntrol Station	
Connect Plus	Active		
XRC Controllers	Name	Control Station 1	
📄 🗤 Шлюз XRT	IP address	192.168.10.1	
Control Stations	Local interface	192.168.10.2	
Control Station 1	Radio ID	1	
R Security Settings	Reserved for		
MAI Systems	Dispatcher		
Capacity Max Networks	Croup	ID 0	
Smart PII Kadioservers		Name Group	

Note: To configure the remote control station properly, please refer to the "Terminal RG-1000' Customer Programming Software User Guide".

The following fields should be filled to connect the control station to SmartPTT Radioserver:

- Name: Control station name.
- IP address: The IP address of the control station. The following address format and range are used: (001-223). (000-255).(001-253). (001-253). Users can use any address except 127.x.x.x in the range from 1.x.x.x to 223.x.x.x. We recommend to use the address 192.168.10.1 by default. In case of conflicts with other network interfaces select a different IP address.
- Local interface: Local interface used for connection to the control station. A question mark at the beginning of the field means that the control station was not defined.

Note: If two or more control stations are connected to the computer, one of the first three octets of the IP address must be unique for each control station.

- Radio ID: The unique identifier of the control station used for communication. This Radio ID must match
 Radio ID set in the settings of the control station. If the control station is used for dispatcher calls, and there
 are more than one operator in the system, Radio ID must match the ID set in the profile of the operator for
 whom the control station is reserved (see Profiles).
- Reserved for: Allows you to define how the control station is to be used. It can be used for private calls (Dispatcher) or for group calls (Talkpath). You can use one control station per one dispatcher or per one talkpath. To allow group calls, select Group, and enter the ID of the talkgroup and its name. To allow private calls to and from the dispatcher, select Dispatcher.

To make and receive private calls from the dispatcher, make sure that in the "MOTOTRBO™ Connect Plus Option

Board CPS" program the **Manual Dial** check box is selected.

To learn how to configure audio settings, see <u>How to Configure Control Station Audio Settings</u>.

Security Settings in Connect Plus

Connect Plus supports two types of privacy mechanisms – Enhanced and Advanced Encryption Standard (AES). The Enhanced Privacy utilizes Motorola proprietary algorithms and therefore is not interoperable with other vendor's privacy offerings. The Enhanced Privacy provides high level of protection by means of 40-bit key length and supports multiple keys in a radio.

The Advanced Encryption Standard (AES) is a specification for the encryption of electronic data established by the U.S. National Institute of Standards and Technology (NIST). The AES feature supports 256-bit key length, unlike Enhanced Privacy. Similar to Enhanced Privacy, the AES also supports multiple keys. For AES encryption a special license is required.

The Security Settings window allows you to specify the encryption keys for incoming and outgoing traffic on the

digital channel.

Control Stations	Security Settings
Connect Plus 1	Copy
XRT VoiceGateways Security Settings NAI Systems	Enhanced Privacy Add Remove
Capacity Max Networks SIP/RTP Interfaces	Key ID Key Value
Smart P11 Hadioservers	AES Add Remove Key ID Key Value TX Privacy Type No Key ID

Copy: Copy encryption settings of the channel to the clipboard.

Paste: Paste encryption settings of the channel from the clipboard.

Enhanced Privacy

To configure **Enhanced Privacy**, perform the following actions:

1. In the Security Settings window of SmartPTT Radioserver Configurator add an enhanced privacy key for

incoming traffic. Enter its ID and value in the corresponding fields.

Click to add the enhanced privacy key	Enhanc Ado	ed Privacy Remove	Click to remove the selected enhanced privacy key	
	Key ID	Key Value		
	1	0123456789		

Note: Key ID and **Key Value** must match the values set in the radio settings in MOTOTRBO CPS and MOTOTRBO Network Interface Service Configuration Utility. If the values in the **Key ID** fields are the same, but the values in the **Key Value** fields do not match, the receiving side hears only a distorted voice. If the key identifier of the transmitting side does not coincide with one of the key identifiers in the list of the receiving side, then transfer to the receiving party will not be heard.

2. In the **Security** window of the radio settings in MOTOTRBO CPS in the **Privacy Type** field select *Enhanced* and add the enhanced privacy key. Enter its ID and value in the corresponding fields (see the <u>Note</u> above).

3. In the **Security** window of the repeater settings in MOTOTRBO CPS in the **Privacy Type** field select

Enhanced.

AES Privacy

To configure the **AES** privacy, perform the following actions:

1. In the Security Settings window of SmartPTT Radioserver Configurator add an AES privacy key for incoming

traffic. Enter its ID and value in the corresponding fields.

Note: Key ID and **Key Value** must match the values set in the radio settings in MOTOTRBO CPS and in MOTOTRBO Network Interface Service Configuration Utility. If the values in the **Key ID** fields are the same, but the values in the **Key Value** fields do not match, the receiving side hears only a distorted voice. If the key identifier of the transmitting side does not coincide with one of the key identifiers in the list of the receiving side, then transfer to the receiving party will not be heard.

2. In the **Security** window of the radio settings in MOTOTRBO CPS in the **Privacy Type** field select *Enhanced* and add the AES privacy key. Enter its ID and value in the corresponding fields (see the <u>Note</u> above).

Туре	No 🔻	Key ID	· · · · · · · · · · · · · · · · · · ·
	No	1	
	Enhanced AES (Legacy Key) AES (Symmetric Key)		

Type: Allows you to select encryption mode for outgoing traffic on the side of SmartPTT Dispatcher.

If No is set, radioserver does not support outbound traffic encryption.

If *Enhanced* is set, specify the **Key ID** value from the **Enhanced Privacy** table, which will be used to encrypt outbound traffic.

Select AES (Legacy Key) or AES (Symmetric Key), with the required Key ID, if you want to use AES (Legacy Key)

or AES (Symmetric Key) for outgoing traffic. If TX Privacy is not set, and you have AES encryption for incoming traffic, AES (Symmetric Key) will be used for incoming traffic by default.

AES (Legacy Key) – AES encryption (Motorola Solutions implementation, MOTOTRBO firmware earlier than R2.4).

AES (Symmetric Key) – AES encryption (DMR-compliant implementation, MOTOTRBO firmware R2.4 and later).

NAI Systems

SmartPTT supports MOTOTRBO Network Application Interface (NAI) protocol for networks such as IP Site Connect, Extended Range Direct Mode, Capacity Plus, and Linked Capacity Plus. NAI network configuration uses this protocol for voice, data and monitoring data transmission.

Currently, you can configure four network types with the NAI protocol:

1. NAI - IP Site Connect

2. NAI - Extended Range Direct Mode

3. NAI - Capacity Plus

4. NAI - Linked Capacity Plus

Note: You can install SmartPTT Radioserver, DDMS and MNIS on the same PC.

The MOTOTRBO Network Interface Service (MNIS) lets you transmit data (text messages, GPS, telemetry, etc.) without control stations. MNIS connects with the repeater system over IP and uses them to transmit and receive data packets.

Note: MNIS allows data transmission only. It does not support transmission of voice calls and CSBK commands (Radio Check, Call Alert commands and so on).

The Device Discovery and Mobility Service (DDMS) is a service that monitors the presence of ARS capable radio units and reports their parameters (IP address, Radio ID, etc.) to interested applications, such as SmartPTT Radioserver and MNIS.

How to Configure NAI System

To add a NAI system, click NAI Systems > Add, and select the network type (NAI - IP Site Connect,

NAI - Extended Range Direct Mode, NAI - Capacity Plus or NAI - Linked Capacity Plus):

🧐 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config			
Settings Networks Client List Rules	Activity Log Export/Import Settings Statistics		
Control Stations	NAI Systems		
NAI Systems			
Capacity Max Add ►	NAI - IP Site Connect		
SmartPTT Radioservers	NAI - Extended Range Direct Mode		
	NAI - Capacity Plus		
	NAI - Linked Capacity Plus		

At that, a new window with network parameters will open. The network parameters differ depending on the selected network type.

		Max number of telephone	e calls	100 🚖
		Data transmission		
		Monitoring		

Name: Name of the created system.

Network ID: Unique ID of the network. The network ID must not match any ID of the other SmartPTT Radioserver networks.

Peer ID: Unique ID of the radioserver in the network. This ID must not match any of the other repeater IDs in this network.

Interface: Local interface of the radioserver. The radioserver plays the role of a software peer.

Port: Port number of the radioserver. It should differ from the corresponding ports in other networks.

Master repeater address (IP Address:Port): IP address and port number of the network Master repeater. Click **Test** to check connection between the radioserver and the Master repeater.

Authentication key: Repeater authorization key (should be equal to the Authentication key in the repeater settings in MOTOTRBO CPS).

Voice transmission can be carried out in two ways: via repeaters and via control stations. To transmit voice via control stations, configure control station parameters and profiles for making private calls. To transmit voice via repeaters, configure virtual control station channels and talkgroups of the channel. The number of channels depends on the network type. To transmit CSBK commands use control stations for voice transfer.

To transmit data and monitoring data select the corresponding check boxes.

Group call hang time: Time during which the repeater reserves the channel for a group call after the end of transmission. During the timeout, only the participants of the talkgroup can transmit.

Private call hang time: Time during which the repeater reserves the channel for a private call after the end of transmission. During the timeout, only the participants of the private call can transmit.

Max number of telephone calls: Sets the limit on the number of simultaneous telephone calls per system.

Note: Max number of telephone calls is not applicable to the NAI - Extended Range Direct Mode systems.

When selecting *NAI - Linked Capacity Plus* network with voice via repeaters, the new section (**Sites**) appears in the settings tree:

Priority Configuratio	Max number of		
Site	Max number of		
	telephone calls	Priority	
Site 1	16	1	₽

Max number of telephone calls: Sets the limit on the number of simultaneous telephone calls per site.

Priority: Priorities should be set on the basis of the radioserver proximity to the site. The closer the radioserver to the site, the higher priority it should have. Thus, you will be able to reduce delay in data transmission.

The following example shows sites' location in respect to the radioserver, and talkgroups' distribution on the sites.

Here, talkgroups 3, 4, 6 are assigned to Site 1; talkgroups 2, 4, 5, 6 – to Site 2; talkgroups 1, 4, and 5 – to Site 3. The **Talkgroups** tab in repeater MOTOTRBO CPS settings allows you to configure group calls as wide area calls on specific sites.

DR 3000 General Settings			Talkgro	oups		
Accessories Central Security Central Security Central Security Network Channels Channels			All Wide Area Talk	cgroups Delete		
	Call ID 1 2 3 4 5 6 ★	Site 1 Image: Constraint of the second se	Site 2	Site 3	Site 4	Site 5

By default, the repeater sends data to Site 1. Then, data goes from Site 1 to other sites. So, if you call to talkgroup 4, the total time delay will be 130 ms.

Setting up the site priorities so that sites with less time delay are associated with a higher priority allows sending data to the nearest site, from which it is distributed to other sites. Ultimately, the total time delay in case of talkgroup 4 reduces up to 70 ms.

	Site	Priority	
•	Site 1	3	
	Site 2	2	=
	Site 3	1	-
	Site 4	4	
	Site 5	5	

If connection with the site of the highest priority fails, the radioserver tries to work through the site of lower priority. To assign site priority, drag the site name to the desired location or use arrows on the right to the table.

Note: Talkgroup distribution data is provided by the **Talkgroups** table on each site (repeater settings in MOTOTRBO CPS).

When selecting *NAI - IP Site Connect* with voice via repeaters, the **Local Slots** table appears. Local slots allow multiple communications at one time. To add a local slot, click the **Add** button above the table.

Control Stations	NAI - IP Site Connect	Network

Name: Name of a local slot, which will be displayed in SmartPTT Radioserver Configurator and SmartPTT

Dispatcher.

Peer ID: The identifier of a repeater.

Slot: Selection between slots (Slot 1 or Slot 2).

To configure NAI - Extended Range Direct Mode, ensure that the following settings are specified:

1. The repeater has the corresponding license in MOTOTRBO CPS.

2. Extended Range Direct Mode has the *Enabled* value in MOTOTRBO CPS.

How to Configure NAI Slots

After you have selected the network type, configure the slots. In order to do that, click the required slot in the **Networks** tab of SmartPTT Radioserver Configurator. At that, the following window appears.

Control Stations	NAI Control Station
Connect Plus	Active
NAI- Linked Capacity Plus 1	Name Slot 1 Radio ID 65535 CAI Network 12 CAI Network for Groups 225 CAI Network for Groups 225 Allow Telephone Interconnect TX Time-Out Timer, s 60 Options Image: Confirmed Allow transmit interrupt GPS Transmission Mode Data Image: Confirmed Events Private calls Private calls

Note: For the NAI - Extended Range Direct Mode, NAI - Capacity Plus orNAI - Linked Capacity Plus networks, there is only one slot to configure.

Name: Slot name.

Slot ID: Local slot identifier. This identifier is used in telephone calls (e.g., when there are many local slots to differentiate between them).

Radio ID: Unique identifier of a virtual control station corresponding to the network slot.

CAI Network: CAI-network identifier. Use the default value of 12 (must match MOTOTRBO CPS settings).

CAI Network for Groups: CAI-network for groups identifier. Use the default value of *225* (must match MOTOTRBO CPS settings).

Allow Telephone Interconnect: Enables telephone calls on the slot.

Note: Allow Telephone Interconnect is not applicable to the NAI - Extended Range Direct Mode systems.

Emergency alarm confirmed: Determines if the emergency alarm is allowed to be acknowledged.

Confirmation of private calls sets private calls on the current digital channel as confirmed.

Allow transmit interrupt: Enables or disables the ability to interrupt a radio subscriber.

Private Calls: Enables or disables the private calls confirmation.

GPS Transmission Mode: Allows you to select the way how to transmit location updates: as a data packet in multiple bursts or as a single CSBK (Control Signaling Block).

Each solution has its own advantages and disadvantages:

GPS Transmission Mode	Advantages	Disadvantages
Data	 No need to configure additional settings for receiving GPS data 	 Increased traffic load on a channel
CSBK	 Low traffic load on a channel Increased GPS transmission frequency rate—once in 15 seconds 	 Not all radios support CSBK commands Additional MNIS settings*
Enhanced CSBK	 Low traffic load on a channel Increased GPS transmission frequency rate—once in 7.5 seconds 	 Not all radios support CSBK commands Additional MNIS settings*

Note: The *Enhanced CSBK* **GPS Transmission Mode** is not applicable to the *NAI - Extended Range Direct Mode* systems.

* To transmit location data using *CSBK* and *Enhanced CSBK*, configure additional MNIS settings, which include adding repeater latitude and longitude. This information is used for calculation of radio locations.

For NAI - IP Site Connect configuration specify latitude and longitude for each network system:

MOTOTRBO Network Interface Service Configuration Utility

Also, to transmit location data using CSBK or Enhanced CSBK, enable CSBK Data in radio settings:

Note: Remember that Enhanced CSBK can be used on Enhanced GPS channels only.

How to Configure NAI Talkgroups

To configure slot groups, click **Talkgroups** in the **Networks** tab of SmartPTT Radioserver Configurator.

Note: The configuration process of the virtual control station talkgroups for *NAI - IP Site Connect, NAI - Extended Range Direct Mode* or *NAI - Capacity Plus* networks is absolutely similar to the configuration of MOTOTRBO control station talkgroups.

For *NAI - Linked Capacity Plus* network type, parameters of wide area and local talkgroups are set in the **Control Station Talkgroups** window. All the configured talkgroups are displayed in SmartPTT Dispatcher. For more information about wide area and local groups of Linked Capacity Plus network see Motorola System Planer. Wide area talkgroup calls are available to the subscribers that are in the coverage area of sites designated in MOTOTRBO CPS for this talkgroup. Select check boxes in the required columns of the **Talkgroups** tab in the repeater MOTOTRBO CPS settings. Each column corresponds to the site where the talkgroup is available for a call.

						Talkgr	oups				
						All Wide Area	Talkgroups]			
						Add	Delete

In order to display wide area talkgroups in SmartPTT Dispatcher, add necessary talkgroups in SmartPTT

Radioserver Configurator, define talkgroup identifiers that correspond to the identifiers of the wide area talkgroups in the repeater MOTOTRBO CPS settings and select *Wide* in the **Site Number** field.

The talkgroups that are not specified in the repeater MOTOTRBO CPS settings are considered as local. The local talkgroup call does not go beyond the site where the call is initiated.

Add the required local talkgroups in SmartPTT Radioserver Configurator, define identifiers for them and select site number from the list in the **Site Number** field.

Note: Make sure that identifiers of wide area and local talkgroups do not match.

Control Stations	Control Station Talkgroups			
NAI Systems	Сору		Paste	
Slot 1	All Call Add Remove	🔒 Up	- Down	1
DDMS Settings	Name	ID	Site Number	
Capacity Max Networks	Group 1	1	Wide	-
SIP/RTP Interfaces	Group 2	2	Wide	-
Smart PIT Radioservers	Group 3	3	Wide	-
	Group 4 - Site 1	4	1	-
	Group 5 - Site 2	5	2	-
	Group 6 - Site 3	6	3	-

It is important to specify all talkgroups supported by the system in SmartPTT Radioserver Configurator. Otherwise, the operator can't initiate a call to such a talkgroup until the talkgroup member has made a group call to the operator.

To add the All Call, click **All Call**. In *NAI - Linked Capacity Plus* networks, you can add a wide All Call and a local All Call, which is limited to one site. To add a wide All Call, which available to all sites, click **All Call**. Make sure that **Site Number** is set to *Wide*. To add an All Call limited to one site, click **All Call**, and in the **Site Number** column select the site number where the All Call will be heard. Please note, that you do not need any IDs for local All Calls. Only dispatchers can initiate the local All Call from the dispatch console.

Note: Local All Calls operate within one site in networks where voice transmission is carried out via a repeater. In hybrid networks, where voice transmission is carried out via a control station, a local All Call operates as the global All Call.

Security Settings

The NAI systems (*IP Site Connect, Extended Range Direct Mode, Capacity Plus, Linked Capacity Plus*) support three types of privacy mechanisms – Basic, Enhanced, and Advanced Encryption Standard (AES).

Both Basic and Enhanced Privacy utilize Motorola proprietary algorithms and therefore are not interoperable with other vendor's privacy offerings. The main differences between Basic and Enhanced Privacy are that the Enhanced Privacy provides higher level of protection by means of 40-bit key length. Enhanced Privacy supports multiple keys in a radio compared to one key in the case of Basic Privacy.

The Advanced Encryption Standard (AES) is a specification for the encryption of electronic data established by the U.S. National Institute of Standards and Technology (NIST). The AES feature supports 256-bit key length, unlike Enhanced Privacy. Similar to Enhanced Privacy, the AES also supports multiple keys. For AES encryption a special license is required.

The **Security Settings** window allows you to specify the encryption keys for incoming and outgoing traffic on the digital channel.

Copy: Copy encryption settings of the channel to the clipboard.

Paste: Paste encryption settings of the channel from the clipboard.

Basic Privacy

To configure **Basic Privacy**, perform the following actions:

 In the Security Settings window of SmartPTT Radioserver Configurator in the Key field specify the key for the basic encryption mode. The value ranges from 1 to 255.

Security Settings					
Сору	Paste				
Basic Privacy Key 1					

Note: Make sure that **Key** set in SmartPTT Radioserver Configurator matches **Basic Privacy Key** set in radio settings in MOTOTRBO CPS and MOTOTRBO Network Interface Service Configuration Utility. If basic encryption keys of receiving and transmitting sides do not match, the receiving side hears only a distorted voice.

 In the Security window of the radio settings in MOTOTRBO CPS in the Privacy Type field select Basic. In the Basic Privacy Key field specify the key for the basic encryption mode. The value ranges from 1 to 255 (see the <u>Note</u> above).

Type: Allows you to select encryption mode for outgoing traffic on the side of SmartPTT Dispatcher.

If No is set, radioserver does not support outbound traffic encryption.

If *Basic* is set, the key specified in the **Key** field in the **Basic Privacy** section is used for encryption of outgoing traffic.

If *Enhanced* is set, specify the **Key ID** value from the **Enhanced Privacy** table, which will be used to encrypt outbound traffic.

Select AES (Symmetric Key) with the required Key ID, if you want to use AES (Symmetric Key) for outgoing traffic. If TX Privacy is not set, and you have AES encryption for incoming traffic, AES (Symmetric Key) will be used for incoming traffic by default.

AES (Symmetric Key) – AES encryption (DMR-compliant implementation, MOTOTRBO firmware R2.4 and later).

How to Configure Control Stations

To transmit voice packets over control station, you need to configure its settings. Control station settings become available, when you select voice packet transmission over control stations, not repeaters.

QL Control Chattana					
Control Stations	NAI - Linked Capacity	y Plus Network			
Connect Plus	Active				
Al- Linked Capacity Plus 1	Name Network ID Peer ID	NAI- Linked Capacity Plus 1

	Data transmission				
	Monitoring				

To configure the control station settings, right-click **Control Stations** and click **Add > MOTOTRBO control station**.

You can also add a remote control station, for more information about a remote control station see this article.

Control Stations	NAI Control Station					
Connect Plus	Active					
NAI- Linked Capacity Plus 1	Name	Control S	itation 1			
Talkgroups	IP Address	192.168	.10.1			
	Radio ID	1				
DDMS Settings	Working Channel	Zone	1	Channel	1	
MNIS Data Gateway	Reserved for					
Capacity Max Networks	Oispatcher					
SmartPTT Radioservers	Talkgroup				•	

Name: Control station name.

IP Address: Local IP address of the control station. The following address format and range are used: *(001-223)*. *(000-255).(001-253)*. *(001-253)*. Users can use any address except 127.x.x.x in the range from 1.x.x.x to 223.x.x.x. We recommend to use the address *192.168.10.1* by default, and in case of conflicts with other network interfaces you should select a different IP address.

Note: If two or more control stations are connected to the PC, one of the first three octets of the IP address must be unique for each control station.

Radio ID: Unique radio identifier used during communication with it. In the IP Site Connect network, the ID is to be set in the range from *1* to *16776415*. In the *NAI - Capacity Plus* or *NAI - Linked Capacity Plus* networks, the ID is to be set in the range from *1* to *65535*.

Working Channel: Select the channel and the zone to be set at the control station at the radioserver launch. Reserved for: Allows you to define how the control station is to be used. It can be used for private calls (Dispatcher) or for group calls (Talkgroup). This parameter is available only for *NAI - Extended Range Direct Mode*, *NAI - Linked Capacity Plus* and *NAI - Capacity Plus* networks. You can use one control station per one dispatcher or per one talkgroup. To allow group calls, select Talkgroup. At that, the dropdown list with added talkgroups becomes enabled. To allow private calls to and from the dispatcher, select Dispatcher and add profiles — one per dispatcher. In the profile, select the reserved control station. At that, ID will change and will match Radio ID set in the NAI Control Station settings.

Note: All Calls can be initiated via a control station reserved for a group. If the control station is reserved for the dispatcher, you can only listen to **All Calls**.

To select audio devices and set up VoIP parameters, click Audio in the Networks tab of SmartPTT Radioserver

Configurator.

Control Stations	Audio Settings			
Connect Plus NAI Systems NAI-Linked Capacity Plus 1 Slot 1 Slot 1 Control Stations Control Station 1 DDMS Settings MNIS Data Gateway Capacity Max Networks SIP/RTP Interfaces Smart PTT Radioservers	Active Audio input DS : Default, 1 Input line Codec Format Audio output	▼ бщая громкость ▼ CITT u-Law ▼ 000 Hz, 20 ms, 64 (86) kbps ▼		
	DS : Default, 1:L	•		

Audio input: An audio device to which the control station audio output is connected.

Input line: Audio mixer line used for connections. The control station audio output can be connected to the line input of the audio device.

Codec: Outgoing audio stream compression method.

Format: Sampling frequency of an outgoing audio stream.

Example:

Specifications of the codec format 8000 Hz, 20 ms, 64 (86) kbps:

8000Hz is the sampling rate

20 ms is the frame size

64 kbps is the voice data bit rate

86 kbps is a full bit rate (required network bandwidth)

Audio output: An audio device to which the control station audio input is connected.

How to configure local slots

As soon as the local slot is added to the **Local Slots** table, a new section appears in the settings tree.

Note: Local slots become available only when Repeater is selected for voice transmission.

Control Stations	NAI Control Station		
Connect Plus	Active		
NAI Systems NAI - IP Site Connect 1 Slot 1 Talkgroups Security Settings Cocal slot 1 Talkgroups Security Settings DDMS Settings MNIS Data Gateway Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers	 Active Peer ID - Slot Peer ID 1, Slot 1 Name Local slot 1 Slot ID 3 Radio ID 16448250 CAI Network 12 CAI Network for Groups 225 Allow Telephone Interconnect TX Time-Out Timer, s 60 Options Emergency alam confirmed Allow transmit interrupt GPS Transmission Mode Data Confirmed Events Private calls 		

Active: Allows you to enable or disable a local control station.

Peer ID - Slot: Peer identifier and slot number. Data is taken from the Local Slot table.

Name: Name of the local slot. It is used in SmartPTT Radioserver Configurator and in SmartPTT Dispatcher.

Slot ID: The identifier of the local slot, which will be used for group calls. This will be used in a group call mask. It must be unique in the system.

Radio ID: Unique radio identifier used during communication. It can match Radio ID of the virtual slots.

CAI Network: CAI-network ID. Use the default value of 12.

CAI Network for Groups: Group CAI-network ID. Use the default value of 225.

Allow Telephone Interconnect: Allows telephone calls on the slot.

TX Time-Out Timer, s: Time period during which the radio can transmit without interruptions. When time is out, the transmission is interrupted.

Emergency alarm confirmed: Determines if the emergency alarm is allowed to be acknowledged.

Allow transmit interrupt: Enables or disables the ability to interrupt a radio subscriber.

Private calls: This feature sets private calls on the current digital channel as confirmed.

GPS Transmission Mode: Allows you to select the way how to transmit location updates: as a data packet in multiple bursts or as a single CSBK (Control Signaling Block). For more information see <u>GPS Transmission Mode</u>. To configure groups of the local slot, click **Talkgroups**. Configure talkgroup settings as ordinary IP Site Connect talkgroups.

If you use encryption, go to **Security Settings**. For more information on how to configure encryption settings, see <u>Security Settings in NAI systems</u>.

DDMS Settings

The Device Discovery and Mobility Service (DDMS) is a service that monitors the presence of ARS capable radio units and reports their parameters (IP address, Radio ID, etc.) to interested applications, such as SmartPTT Radioserver and MNIS.

To set up DDMS settings, click **DDMS Settings**.

Control Stations Connect Plus	DDMS Settings

l	(*) (*)	>

MNIS ID: The Common Air Interface (CAI) ID of the MNIS in the radio network. The ID is used by other calling radios when addressing MOTOTRBO Network Interface Service. Make sure MNIS ID matches the MNIS Application ID field in the General chapter of MOTOTRBO Network Interface Service Configuration Utility. It is also recommended that MNIS ID should match Radio ID in the radioserver slot settings.

Remote Socket is used when you want to connect more than one network such as Capacity Plus or Linked Capacity Plus to SmartPTT Radioserver. To ensure proper functioning of all connected networks (voice and/or data transmission), each network requires separate MNIS and DDMS services set up and running. At the same time, multiple MNIS and DDMS can't be installed on one PC. To work around this problem, you should install and configure MOTOTRBO Network Interface Service Configuration Utility, MOTOTRBO DDMS Administrative Client and MNIS Data Gateway Relay applications on multiple PCs. The number of PCs depends on the number of networks (Capacity Plus or Linked Capacity Plus) connected to SmartPTT Radioserver. Thus, the transmission of voice data from repeaters to SmartPTT Radioserver is carried out directly, and data transfer – via PC with MNIS Relay and the MNIS and DDMS service applications.

To configure this type of connection:

- 1. Install and run MNIS Data Gateway Relay on the computer where MOTOTRBO Network Interface Service is running.
- 2. Run the MNIS Data Gateway Relay Configurator.

🎯 MNIS Data Gateway Settings					
MNIS Data Gatewa	у				
MNIS interface:	192.0.2.2				
Server interface:	192.0.2.2 Port: 8890				

- In the MNIS interface field enter the same address as it is in the Tunnel IP Address of MOTOTRBO Network Interface Service Configuration Utility.
- 4. In the Server interface field enter the same address as you did in the previous step.
- 5. In the **Port** type the available port of the computer.
- 6. Save changes and restart MNIS Data Gateway Relay.
- 7. In SmartPTT Radioserver Configurator double-click your network and click MNIS Data Gateway.
- 8. In the Socket Type field select Remote Socket.
- In the MNIS Control Interface field type IP address of the computer where MOTOTRBO Network Interface Service service is running and the port from the MNIS Control Interface TCP Port field of MOTOTRBO Network Interface Service Configuration Utility.
- 10. In the **MNIS Relay Address** field type IP address of the computer where MNIS Data Gateway Relay service is running and the port from the **Port** field of MNIS Data Gateway Relay Configurator.

MNIS Data Gateway	
Socket Type	Remote Socket
MNIS Control Interface	203.0.113.1:55000
MNIS Relay Address	203.0.113.1: <u>8890</u>
MNIS ID	1 MNIS Control Interface TCP Port
Location Port	4001 (MNIS Configuration Utility)
TMS Port	4007
Telemetry Port	4008 (MNIS Data Gateway Relay)

- 11. Configure other settings as describer previously.
- 12. Save changes and restart radioserver.

You should repeat this for every MOTOTRBO Network Interface Service data gateway you are installing.

MNIS and DDMS service settings

The following section describes MNIS service settings in MOTOTRBO Network Interface Service Configuration Utility and DDMS service settings in MOTOTRBO DDMS Administrative Client, which are necessary for proper data transmission over network.

You should configure the following settings in the MOTOTRBO Network Interface Service Configuration Utility application:

 In the System Operation Mode field of the General section, select a mode depending on the network type selected in SmartPTT Radioserver Configurator. If NAI - IP Site Connect is used, select *Conventional*. Other modes correspond to the NAI - Capacity Plus and NAI - Linked Capacity Plus networks.

 In the Security section set the encryption keys that match the keys specified in the radio MOTOTRBO CPS settings.

• 12 General		Seci	urity	-	E	= () ()	P 3601 General Settings			Secur	rity

- Set up the following parameters in the Conventional/Capacity Plus/Linked Capacity Plus sections respectively:
 - IP address and UDP port of the Master repeater in the Master IP Address and the Master IP Port fields. These values should match the values in the corresponding fields in the Master repeater MOTOTRBO CPS settings and in the network settings of SmartPTT Radioserver Configurator.
 - Authentication key, if it is set in the repeater MOTOTRBO CPS settings.
 - Privacy settings that match repeater encryption settings in MOTOTRBO CPS.

 It is recommended to clear the Data Call Confirmed field in the Advanced section and to specify the identifier in the MNIS LE ID field explicitly.

		(Manually Assigned 5195

DDMS operation is closely connected to MNIS for data exchange (MNIS serves as DDMS Watcher). DDMS filteres the registration service packets (ARS), received by the repeater, and information on the radio presence in the network is sent to all systems for further processing. Therefore, when you configure DDMS settings, make sure that:

 a) The **PortWatcher** field in MOTOTRBO DDMS Administrative Client matches the **WatcherPort** field in MOTOTRBO Network Interface Service Configuration Utility settings (**Advanced > Network**).

Capacity Max

Capacity Max is a trunking MOTOTRBO system that supports the European Telecommunications Standards Institute (ETSI) Digital Mobile Radio (DMR) Tier III operation.

Capacity Max system represents the enhancement of the Linked Capacity Plus functionality. It can include up to 15 sites and up to 15 trunked repeaters with up to 3,000 users per site. One slot on each site is allocated as a control channel. Capacity Max also supports data revert repeaters: up to 6 per site and 12 time channels per site. Capacity Max system supports connection via control stations. The parameters of the control station correspond to

the parameters of an ordinary MOTOTRBO control station.

Capacity Max systems offer the following advantages:

• The simple and efficient system architecture that utilizes standard Internet protocol (IP) network with a centralized Capacity Max System Server (CMSS).

CMSS represents the VMware Sphere version 5.5 ESX server and includes the following virtual resources:

- o Trunking Controller based on the Red Hat Linux,
- o MNIS VRC gateway, and
- Radio Management application that is used instead of MOTOTRBO Customer Programming Software (CPS) to configure the system.

The system architecture also includes the MNIS Data gatewaty, which is installed separately.

- High security. All voice, data and control traffic within the IP network is encrypted, and all radios are securely authenticated.
- High level of reliability and resilience. The system can include an optional redundant server in addition to the main server and up to three alternate control channels per site.

Capacity Max is compatible with all MOTOTRBO repeaters, except DR3000 series with the 8MB RAM, and all

MOTOTRBO 4000 series portable and/or mobile radio stations.

To configure the Capacity Max system in SmartPTT Radioserver Configurator, you will need to use the following applications:

- Radio Management application-to get the settings of the preconfigured virtual resources, and
- MOTOTRBO Network Interface Service Configuration Utility—to set up the MNIS Data gateway.

Capacity Max configuration in SmartPTT Radioserver Configurator includes the following steps:

1. Adding new network and its basic configuration.

- 2. Setting up the trunking controller.
- 3. Setting up <u>MNIS Data gateway settings</u> for data transfer.
- 4. Setting up the <u>MNIS VRC gateway</u> and the talkgroups.
- 5. Setting up the security settings.

How to Configure Capacity Max

To add a new Capacity Max system, right-click Capacity Max Networks in the Networks tab of SmartPTT

Radioserver Configurator and click Add.

At that, Capacity Max System configuration menu appears on the right.

Control Stations	Capacity Max System	
NAI Systems	Active	
Capacity Max Networks Capacity Max 1 Trunking Controller MNIS Data Gateway MNIS VRC Gateways MNIS VRC Gateway 1 Talkgroups SIP/RTP Interfaces SmatPTT Radioservers	Name: Network ID: Radio ID: Interface: Presence information Data transmission Voice transmission Allow transmit interrup Prioritize calls during to Channel Grant Waiting to TX time-out timer (s): GPS transmission mode:	Capacity Max 1 1 1 1 Any t t emergency mer (s): 15 60

Name: Name of the created system.

Network ID: Unique ID of the network. The network ID must not match any ID of other SmartPTT Radioserver networks.

Radio ID: The identifier of the radioserver. This is the identifier radio subscribers will see at receiving private calls and text messages from the dispatcher. If there are several dispatchers, you can create a profile for each operator (<u>Profiles</u>) and define a unique identifier for each operator. **Radio ID** set in this window must correspond to the value set in the **Device ID** field for the preconfigured radioserver device in the Radio Management application (see the **Capacity Max Systems** settings, sorted by the **Subscriber Access Control** value).

Analyze Results Tasks						
onnected To:LOCALHOST						

Note: To open the Capacity Max System settings in the Radio Management application, click Actions > Manage > Capacity Max System Server Data or press the Ctrl+Shift+G together.

Interface: The IP address of the PC where SmartPTT Radioserver is installed.

Presence information: Select this check box to enable connection with Trunking Controller.

Data transmission: Select this check box to work with MNIS Data Gateway.

Voice transmission: Select this check box to enable MNIS VRC Gateway.

Allow transmit interrupt: Select this check box if you need the ability to interrupt a radio subscriber.

Prioritize calls during emergency: Sets a priority of the dispatcher call during the Emergency Call. If the check box is selected, the dispatcher call has the highest priority during the Emergency Call in relation to other calls and interrupts them in case of lack of resources.

Channel Grant Waiting timer (s): Time period in seconds during which the caller expects a response from the called party (the FOACSU strategy). It is recommended to use the default value of 15 seconds that is set in the Radio Management application (see the **Capacity Max Systems:...** settings in the **Capacity Max Features** menu of the **Primary_CMSS_config** configuration, the **Channel Grant Waiting timer** field in the **Timers** tab).

Note: To open the Capacity Max Features of the Primary_CMSS_config configuration in the Radio Management application, click Actions > Manage > Configurations or press Alt+C together. In the table that opened, select the Primary_CMSS_config item and click Edit. In the Set Categories tab that opened, click Configuration: Primary_CMSS_config > Capacity Max Features.

FOACSU (Full Off Air Call Set Up) stands for the strategy of assigning the traffic channel only when the called party user has specifically answered the call. During the timeout the traffic channel is not allocated for the call.

For correct work of the FOACSU private calls, make sure that it is configured in the Radio Management application (see the **Capacity Max Systems:...** settings in the **Capacity Max Features** menu of the **Primary_CMSS_config** configuration, the **Individual Voice Call Type** field in the **General** tab).

TX time-out timer (s): Time period during which the radio can transmit without interruptions. After this time is over, the transmission is interrupted. It is recommended to use the default value of 60 seconds, which is set in the Radio Management application (see the **MNIS System** settings in the **MNIS** menu of the **Primary_CMSS_config** configuration, the **Transmission TOT** field in the **General** tab).

Note: To open the MNIS menu of the Primary_CMSS_config configuration in the Radio Management application, click Actions > Manage > Configurations or press Alt+C together. In the table that opened, select the Primary_CMSS_config item and click Edit. In the Set Categories tab that opened, click Configuration: Primary_CMSS_config > MNIS.

GPS Transmission Mode: Allows you to select the way how to transmit location updates: as data packet in multiple bursts or as a single CSBK (Control Signaling Block).

GPS Transmission Mode	Advantages	Disadvantages
Data	 No need to configure additional settings for receiving GPS data 	 Increased traffic load on a channel
CSBK	Low traffic load on a channel	Not all radios support CSBK commands

Each solution has its own advantages and disadvantages:

	Increased GPS transmission frequency	
	rate—once in 15 seconds	
Enhanced CSBK	Low traffic load on a channel	Not all radios support CSBK commands
	Increased GPS transmission frequency	
	rate—once in 7.5 seconds	

Trunking Controller

Trunking controller of the Capacity Max network provides the actual information about the network status (registered subscribers).

To configure primary trunking controller:

 Make sure that trunking controller is configured via the Radio Management program, in particular, you can obtain IP address and port from the **Presence Server IP** field. For their configuration, please refer to the Motorola Radio Management User Guide.

Capacity Max supports up to four redundant trunking controllers to keep the subscribers online when the primary controller goes offline. The order of redundancy is defined by the settings in Radio Management.

To configure additional trunking controllers:

1. Make sure that redundant trunking controllers are configured in Radio Management.

If MOTOTRBO Network Interface Service and the SmartPTT Radioserver are running on different computers, or you configure several MNIS Data Gateways, perform the following actions:

- 1. Install and run MNIS Data Gateway Relay on the computer where MOTOTRBO Network Interface Service is running.
- 2. Run the MNIS Data Gateway Relay Configurator.

🎯 MNIS Data Gat	eway Settings	
MNIS Data Gatewa	iy	
MNIS interface:	192.0.2.2	
Server interface:	192.0.2.2	Port: 8890 🚔

- In the MNIS interface field enter the same address as it is in the Tunnel IP Address of MOTOTRBO Network Interface Service Configuration Utility.
- 4. In the **Server interface** field enter the same address as you did in the previous step.
- 5. In the **Port** type the available port of the computer.
- 6. Save changes and restart MNIS Data Gateway Relay.

- 7. In SmartPTT Radioserver Configurator double-click your network and click MNIS Data Gateway.
- 8. In the **Socket Type** field select *Remote Socket*.
- In the MNIS Control Interface field type IP address of the computer where MOTOTRBO Network Interface Service service is running and the port from the MNIS Control Interface TCP Port field of MOTOTRBO Network Interface Service Configuration Utility.
- 10. In the **MNIS Relay Address** field type IP address of the computer where MNIS Data Gateway Relay service is running and the port from the **Port** field of MNIS Data Gateway Relay Configurator.

MNIS Data Gateway	
Socket Type	Remote Socket
MNIS Control Interface	203.0.113.1:55000
MNIS Relay Address	203.0.113.1:8890
MNIS ID	1 MNIS Control Interface TCP Port
Location Port	4001 (MNIS Configuration Utility)
TMS Port	4007
Telemetry Port	4008 (MNIS Data Gateway Relay)

- 11. Configure other settings as describer previously.
- 12. Save changes and restart radioserver.

MNIS VRC Gateway

Every Capacity Max network supports up to 15 MNIS VRC gateways. The first gateway is created always exists in the network, so you can add 14 gateways more.

The order of the gateways matters a lot. All newly created profiles and talkgroups for your Capacity Max network will be assigned for the first MNIS VRC Gateway in the list. Therefore, you should be careful when configure several

MNIS VRC Gateways.

To configure MNIS VRC gateway:

1. Make sure that VRC Gateway is configured in the "Radio Management" program. For more information please refer to Radio Management User Guide.

To add a talkgroup, click **Add**. To add an All Call, click **All Call**. The added talkgroups will also appear in the **Profiles** window. To change the order of groups in the list, use the **Up** and **Down** arrows. The order defined in the window will be used in SmartPTT Dispatcher. To copy added groups to the clipboard, click **Copy**. To paste copied groups from the clipboard, click **Paste**. To delete the selected talkgroup, click **Remove**.

Name: Talkgroup alias displayed by the control station.

ID: Talkgroup unique identifier used during communications. It should be set in the range of *1–65535* for a talkgroup, and in the ranges of *1–16776415*, *16777056–16777183* or should be equal to *16777214* for an All Call.

To edit the talkgroup name or ID, set the cursor on the corresponding field and make changes.

Site Number: Site number list allowed for transmitting. In the Capacity Max network the talkgroups can be only wide-area, while All Call can be wide-area or local.

Note: In the Capacity Max network you can add only wide-area talkgroups, so only the *Wide* value is available for groups in the **Site Number** field. In order to display wide area talkgroups in SmartPTT Dispatcher, add necessary talkgroups in SmartPTT Radioserver Configurator, define talkgroup identifiers that correspond to the identifiers of the wide-area talkgroups in the Radio Management settings. You can add a wide-area All Call and a local All Call, which is limited to one site. To add a wide-area All Call, which is available to all sites, click **All Call**. Make sure that **Site Number** is set to *Wide*. To add an All Call limited to one site, click **All Call**, and in the **Site Number** field select the site number where the All Call will be heard. Please note, that you do not need any IDs for All Calls.

Voice gateway: List of available voice gateways. You can assign a certain voice gateway for each talkgroup.

Note: If there are some available voice gateways, all talkgroups will use by default the first voice gateway in the list. If the talkgroup is not registered on any voice gateway, the **Voice gateway** field will be empty. If <u>Voice</u> <u>transmission</u> is not selected in the Capacity Max network settings, the **Voice gateway** column will be hidden.

You should create talkgroups in accordance with the settings in the Radio Management program (see the **Capacity Max Systems** settings, sorted by the **Talkgroup Site Association** value). For more detailed information, please refer to the Motorola Radio Management User Guide.

Note: To open the Capacity Max System settings in the Radio Management program, click Actions > Manage > Capacity Max System Server Data.

Security Settings

Capacity Max network supports two types of privacy mechanisms – Enhanced and Advanced Encryption Standard (AES). The Enhanced Privacy utilizes Motorola proprietary algorithms and therefore is not interoperable with other vendor's privacy offerings. The Enhanced Privacy provides high level of protection by means of 40-bit key length and supports multiple keys in a radio. The Advanced Encryption Standard (AES) is a specification for the encryption of electronic data established by the U.S. National Institute of Standards and Technology (NIST). The AES feature supports 256-bit key length, unlike Enhanced Privacy. Similar to Enhanced Privacy, the AES also supports multiple keys. For AES encryption a special license is required.

The Security Settings window allows you to specify the encryption keys for incoming and outgoing traffic on the

digital channel.

Control Stations	Security Settings
NAI Systems	Copy Paste
Capacity Max 1	Enhanced Privacy Add Remove
MNIS VRC Gateways MNIS VRC Gateway 1 Talkgroups SIP/RTP Interfaces SmartPTT Radioservers	Key ID Key Value
	AES
	Add Remove
	Key ID Key Value
	TX Privacy Type No Key ID

Copy: Copy encryption settings of the channel to the clipboard.

Paste: Paste encryption settings of the channel from the clipboard.

Enhanced Privacy

To configure **Enhanced Privacy**, perform the following actions:

1. In the Security Settings window of SmartPTT Radioserver Configurator add an enhanced privacy key for

incoming traffic. Enter its ID and value in the corresponding fields.

Click to add the enhanced privacy key	Click to remove the selected enhanced privacy key Add Remove
	Key ID Key Value
	1 0123456789

Note: Key ID and **Key Value** must match the values set in the radio settings in the Radio Management program and MOTOTRBO Network Interface Service Configuration Utility. If the values in the **Key ID** fields are the same, but the values in the **Key Value** fields do not match, the receiving side hears only a distorted voice. If the key identifier of the transmitting side does not coincide with one of the key identifiers in the list of the receiving side, then transfer to the receiving party will not be heard.

2. In the **Privacy Keys** tab of the Radio Management program add the enhanced privacy key. Enter its ID and value in the corresponding fields (see the <u>Note</u> above).

TX Privacy

Type N	• •	Key ID	-	
N	0			
Er Al	nhanced ES (Symmetric Key)			

Type: Allows you to select encryption mode for outgoing traffic on the side of SmartPTT Dispatcher.

If No is set, radioserver does not support outbound traffic encryption.

If Enhanced is set, specify the Key ID value from the Enhanced Privacy table, which will be used to encrypt outbound traffic.

Select AES (Symmetric Key), with the required Key ID, if you want to use AES (Symmetric Key) for outgoing traffic. If TX Privacy is not set, and you have AES encryption for incoming traffic, AES (Symmetric Key) will be used for incoming traffic by default.

AES (Symmetric Key) – AES encryption (DMR-compliant implementation, MOTOTRBO firmware R2.4 and later).

SIP/RTP Interfaces

Backed up with Cisco special hardware, SmartPTT can operate with cable radio networks. The cable radio network interface allows converting analog voice signals into digital IP packets. So far, we have run successful tests on Cisco 2900 only.

Cable radio networks allow SmartPTT to connect to analog radio systems and other systems supporting cable radio network interfaces. The dispatcher can monitor calls from and to these systems. In this version, only All Calls and Group Calls are supported. Group Calls require additional bridging configurations.

Note. Cable radio network support requires a special license.

To add a cable radio network interface, right-click **SIP/RTP Interfaces** and click **Add**. The following window will open:

Control Stations Connect Plus NAI Systems Capacity Max Networks SIP/RTP Interfaces SIP/RTP Interface 1 SIP/RTP gateway SmartPTT Radioservers	SIP/RTP Interface
	Name SIP/RTP Interface 1
	Interface Auto Port 5060
	Master Peer Address (IP Address:Port) remotehost:5060
	Start RTP Port 18650
	No Voice Timer, ms
	Call Hang Time, ms
	Idle SIP/RTP device disconnect timer, s

Active: Enables the network.

Name: Network name, which will be used in SmartPTT Dispatcher.

Network ID: Unique ID of the network, which is used inside SmartPTT system. It is important that you have no other network with the same **Network ID**.

Interface: A local IP address which is used as gateway between the radioserver and Cisco hardware. This IP address must also be defined in the Cisco device settings.

Port: Port number used for interconnection between the radioserver and Cisco hardware. This port must not be used in any other networks. The default value is *5060.*

Master Peer Address (IP Address:Port): The IP address and port of the SIP/RTP device (Cisco hardware), which is used as the network master peer.

Start RTP Port: This is the first RTP port is to be used by the SIP/RTP device for voice channels. The default value is *18650*.

No Voice Timer, ms: Time period for which the radioserver reserves the channel for a call session. If during this time period the SIP/RTP device has not sent any voice packet, the radioserver activates **Call Hang Time**.

Call Hang Time, ms: Time period during which the radioserver reserves the channel for a call after the end of transmission. During the timeout, only the participants of the call can transmit.

Send KeepAlive timer, ms: Time interval for the radioserver to send a special packet (keepalive) to the SIP/RTP device to notify that the radioserver is active and running.

Idle SIP/RTP device disconnect timer, s: Time interval when the radioserver waits for a special packet (keepalive) from the SIP/RTP device to notify that the device is active and running. If the radioserver has not received this packet from the SIP/RTP device during this time period, the device gets the Offline status.

SIP/RTP gateway

To set up the SIP/RTP gateway, click SIP/RTP gateway. At that, the following window will open:

Control Stations	SIP/RTP gateway
NAI Systems Capacity Max Networks	Active
SIP/RTP Interfaces	Name SIP/RTP gateway
SmatPTT Badioservers	Local SIP ID 16448250
	Peer ID 1
	TX Timeout Timer, s 60 荣
	Disconnect Timeout, s 10

Active: Enables the SIP/RTP gateway.

Name: Any random name of the SIP/RTP gateway. It used only in SmartPTT Radioserver Configurator.

Local SIP ID: The identifier of the radioserver. This will be used as a Radio ID by radio subscribers wishing to make the incoming All Call.

Peer ID: The identifier of the Cisco device. This will be used as a Radio ID for outgoing calls.

TX Timeout Timer, s: Time period during which the radio can transmit without interruptions. After this time is over, the transmission is interrupted.

Disconnect Timeout, s: Time period during which the channel is blocked one way after **TX Timeout Timer** expiration. After this time period is over, the channel becomes available for transmission. While the channel is blocked, calls going in the opposite direction are not affected.

SmartPTT Radioservers

SmartPTT Bridging service allows joining two radioservers into a single radio network with the help of intelligent means of patching for voice and data streams. Thus, radio subscribers or talkgroups under control of one radioserver become available for another radioserver for voice call and data packet transmissions.

Note: Currently, bridging service between two radioservers is supported with all network topologies, except for topologies with control stations.

SmartPTT Bridging service allows joining radio networks, managed by two different radioservers, to cover distributed regions. The important advantages of the network are dynamic redirection of private and group calls and data packets from one radioserver to another, and short voice delay (60 ms).

How to Configure SmartPTT Radioservers

Configuration of bridging service between two radioservers includes:

- 1. Adding an external radioserver:
 - basic configuration of the external radioserver
 - control station configuration of the external radioserver
 - talkgroup configuration
- 2. Activating bridging service
- 3. Configuring bridging settings in SmartPTT Dispatcher

These actions are required for both joined radioservers in the system.

SmartPTT Radioservers

To add a new external radioserver, right-click SmartPTT Radioservers in the setting tree of the Networks tab of

SmartPTT Radioserver Configurator and click Add.

Configuring SmartPTT Radioserver

To configure the newly added network, click SmartPTT Radioserver 1 under SmartPTT Radioservers. At that,

the following window opens.

Control Stations Connect Plus NAI Systems Capacity Max Networks SIP/RTP Interfaces	SmartPTT Radios	server	
	Active		
	Name	SmartPTT Radioserver 1	
SmartPTT Radioservers	Network ID	1	
Control Station Talkgroups Security Settings	Peer ID	1	
	Interface	192.168.37.85 V Port	50000 🚔
	Link Type	Peer -	
	Master Radioserver Address (IP Address:Port)	192.168.0.142:50000	Test
	Messaging Delay, m	IS	60 🌲
	Group Call Hang Tin	ne, ms	3000 🜩
	Private Call Hang Ti	me, ms	4000
	Emergency Call Har	ng Tìme, ms	4000 🚖
	Authentication Key		

Name: SmartPTT Radioserver system name.

Network ID: Unique ID of the SmartPTT Radioserver system.

Peer ID: Unique ID of the radioserver in the network.

Warning! Peer ID must be unique. No other repeater in this network can have the same ID.

Interface: IP address of the local SmartPTT Radioserver. Specify the IP address of the PC where the radioserver is installed.

Port: A port number associated with the IP address of the local SmartPTT Radioserver.

Warning! Port number must be unique.

Link Type: Select the role of the local SmartPTT Radioserver: Peer or Master.

Master Radioserver Address (IP Address:Port): IP address and port of the other SmartPTT Radioserver, which plays the role of the Master in the network.

Note: Select Master in the Link Type field for one of the radioservers acting as a master, select Peer for another. If Master is selected in the Link Type field, the Master Radioserver Address field becomes dimmed. If Peer is selected in the Link Type field, make sure that the Master Radioserver Address field contains the interface and port number of the master repeater, that is the second radioserver.

Messaging Delay, ms: Message exchange delay between repeaters.

Group Call Hang Time, ms: Duration for which the repeater reserves the channel after the end of a group call transmission. During this time, only members of the talkgroup that the channel is reserved for can transmit. After expiration of the group call hang timer, the radio will transmit using the TX contact name (digital group) specified for this channel in MOTOTRBO CPS.

Private Call Hang Time, ms: Duration for which the repeater reserves the channel after the end of a private call transmission. During this time, only members of the private call that the channel is reserved for can transmit. After the hang timer expires, the radio transmits using the TX contact name specified for this channel in MOTOTRBO CPS.

Emergency Call Hang Time, ms: Duration for which the repeater reserves the channel after the end of an emergency call transmission. During this time, only members of the talkgroup that the channel is reserved for can transmit.

Authentication Key: Repeater authorization key (to be equal to the Authentication key in MOTOTRBO CPS).

To delete the SmartPTT Radioserver, right-click on the selected SmartPTT Radioserver system and click **Delete**.

Control Station Configuration

To set up the SmartPTT Radioserver control station, right-click **Control Station** in the setting tree of the **Networks** tab SmartPTT Radioserver Configurator. At that, the following window opens.

Control Stations	SmartPTT Control	Station	
MAI Systems	Active		
Capacity Max Networks	Name	Control Station	
	Radio ID	1]
Control Station	CAI Network	12]
Security Settings	CAI Network for Groups	225]
	Allow Telephone	Interconnect

	Options		
	Emergency alar	m confirmed	
	Allow transmit in	terrupt	
	Compressed UD)P data header	
	Confirmed Events		
	Private calls		
	Data calls		

Name: Virtual control station name.

Radio ID: ID of a virtual control station of the network.

CAI Network: CAI-network ID. Use default value of 12.

CAI Network for Groups: CAI-network for groups ID. Use default value of 225.

Allow Telephone Interconnect: Allow telephone interconnect on the channel.

TX Time-Out Timer, s: Continuous radio transmission timeout. After this time, transmission is interrupted.

Emergency alarm confirmed: Determines if the emergency alarm is allowed to be acknowledged.

Allow transmit interrupt: Enables or disables the ability to interrupt a radio subscriber.

Compressed UDP data header: Enabling this item reduces delays in data transmissions.

Private calls: This feature sets private calls on the current digital channel as confirmed.

Data calls: This feature enables individual packets in data calls (ARS, GPS and Text Message) on the current digital channel or personality to be confirmed.

Configuring Talkgroups

To configure talkgroups, click **Talkgroups** in the setting tree of SmartPTT Radioserver Configurator. At that, the **Control Station Talkgroups** window opens.

Control Stations	Control Station Talkgroups			
NAI Systems Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers SmartPTT Radioserver 1 Control Station	Сору	Paste		
	All Call			
	Name	ID Down		
	All Call			
	Group 1	1		

Note: Configuration process of SmartPTT Radioserver control station talkgroups for this network is similar to the configuration of control station talkgroups (see <u>Control Station > Talkgroups</u>).

Security Settings

SmartPTT Radioservers support three types of privacy mechanisms – Basic, Enhanced, and Advanced Encryption Standard (AES).

Both Basic and Enhanced Privacy utilize Motorola proprietary algorithms and therefore are not interoperable with other vendor's privacy offerings. The main differences between Basic and Enhanced Privacy are that the Enhanced Privacy provides higher level of protection by means of 40-bit key length. Enhanced Privacy supports multiple keys in a radio compared to one key in the case of Basic Privacy.

The Advanced Encryption Standard (AES) is a specification for the encryption of electronic data established by the U.S. National Institute of Standards and Technology (NIST). The AES feature supports 256-bit key length, unlike Enhanced Privacy. Similar to Enhanced Privacy, the AES also supports multiple keys. For AES encryption a special license is required.

The Security Settings window allows you to specify the encryption keys for incoming and outgoing traffic on the

digital channel.

Enhanced Privacy

To configure **Enhanced Privacy**, perform the following actions:

1. In the Security Settings window of SmartPTT Radioserver Configurator add an enhanced privacy key for

incoming traffic. Enter its ID and value in the corresponding fields.

Click to add the enhanced privacy key	Enhanced Privacy Add Remove	move the nhanced y key
	Key ID Key Value	
	1 0123456789	

Note: Key ID and **Key Value** must match the values set in the radio settings in MOTOTRBO CPS and MOTOTRBO Network Interface Service Configuration Utility. If the values in the **Key ID** fields are the same, but the values in the **Key Value** fields do not match, the receiving side hears only a distorted voice. If the key identifier of the transmitting side does not coincide with one of the key identifiers in the list of the receiving side, then transfer to the receiving party will not be heard.

2. In the **Security** window of the radio settings in MOTOTRBO CPS in the **Privacy Type** field select *Enhanced* and add the enhanced privacy key. Enter its ID and value in the corresponding fields (see the <u>Note</u> above).

3. In the **Security** window of the repeater settings in MOTOTRBO CPS in the **Privacy Type** field select

Enhanced.

AES Privacy

To configure the **AES** privacy, perform the following actions:

1. In the Security Settings window of SmartPTT Radioserver Configurator add an AES privacy key for incoming

traffic. Enter its ID and value in the corresponding fields.

Note: Key ID and **Key Value** must match the values set in the radio settings in MOTOTRBO CPS and in MOTOTRBO Network Interface Service Configuration Utility. If the values in the **Key ID** fields are the same, but the values in the **Key Value** fields do not match, the receiving side hears only a distorted voice. If the key identifier of the transmitting side does not coincide with one of the key identifiers in the list of the receiving side, then transfer to the receiving party will not be heard.

2. In the **Security** window of the radio settings in MOTOTRBO CPS in the **Privacy Type** field select *Enhanced* and add the AES privacy key. Enter its ID and value in the corresponding fields (see the <u>Note</u> above).

	No	1	
	Enhanced AES (Symmetric Key)]	

Type: Allows you to select encryption mode for outgoing traffic on the side of SmartPTT Dispatcher.

If No is set, radioserver does not support outbound traffic encryption.

If *Basic* is set, the key specified in the **Key** field in the **Basic Privacy** section is used for encryption of outgoing traffic.

If *Enhanced* is set, specify the **Key ID** value from the **Enhanced Privacy** table, which will be used to encrypt outbound traffic.

Select AES (Symmetric Key) with the required Key ID, if you want to use AES (Symmetric Key) for outgoing traffic. If TX Privacy is not set, and you have AES encryption for incoming traffic, AES (Symmetric Key) will be used for incoming traffic by default.

```
AES (Symmetric Key) – AES encryption (DMR-compliant implementation, MOTOTRBO firmware R2.4 and later).
```

Bridging Service

To activate the bridging service, click **Bridging** in the setting tree of SmartPTT Radioserver Configurator. In the opened window select the **Active** check box (see the <u>Bridging</u> section in the Help of SmartPTT Radioserver Configurator).

Bridging Service in SmartPTT Dispatcher

To set up the redirection of voice calls and data packets correctly, configure routes, route groups and profiles for the bridging service in SmartPTT Dispatcher. For more information see **Bridging** in the Help file of SmartPTT Dispatcher.

Example

The following example presents bridging configuration between two radioservers. Each of them works with the IP Site Connect network topology.

User 1 (in SmartPTT Radioserver Configurator) makes the settings for direct connection of the radioserver to repeaters' network, functioning in IP Site Connect system (**Network ID** = 1).

The IP address and port number of the master repeater must be specified in the Master Repeater Address field

(the example displays connection settings only with one repeater).

In the Interface field select the IP address of the virtual repeater in the network with Network ID = 1.

NAI - IP Site Connect Network								
Active								
Name	NAI - IP Site Connect 211							
Network ID	2							
Peer ID	1							
Interface	192.168.37.85 v Port	50000 🚔

User 2 also configures the IP Site Connect network connection (**Network ID** = 2) in SmartPTT Radioserver Configurator. Fill in the **Master Repeater Address** and the **Interface** fields with data corresponding to the network with **Network ID** = 2.

Next, *user 1* adds the SmartPTT radioserver (Radioserver 111) with the **Master** link type and chooses the corresponding IP address in the **Interface** field of SmartPTT Radioserver Configurator.

User 2 also adds the SmartPTT radioserver (Radioserver 211) and defines its connection type as a **Peer**. In the

Master Radioserver Address field User 2 specifies the IP address and port number of the Master repeater.

After that, both user 1 and user 2 activate the bridging service in SmartPTT Radioserver Configurator.

To apply settings, click **Save** and restart the service in SmartPTT Radioserver Configurator (for user 1 and user 2).

In the SmartPTT Dispatcher application of *user 1* (Master), a radio with the **IP address** = *12.0.0.95* is registered at Slot 111_1. The SmartPTT radioserver (*user 2*) with its radios and talkgroups is shown in the *user 1* system as Control Station 111. In SmartPTT Dispatcher of *user 2*, a radio with the **IP address** = *12.0.1.148* is registered at Slot 211_1. SmartPTT radioserver (*user 1*) in respect to *user 2* is displayed as Control Station 211.

In SmartPTT Dispatcher of *user 1* set up the bridging service of voice calls and data. To do this, create a group with routes to redirect calls of all types in duplex mode (from Slot 111_1 and Slot 111_2 to Control Station 111). Make this route group active.

User 2:

To redirect only group calls between two radioservers without setting up routes in SmartPTT Dispatcher, create multigroups with the list of radios, that support group call bridging in SmartPTT Radioserver Configurator (for both radioservers). For more details see the <u>Multigroups</u> section in the Help of SmartPTT Radioserver Configurator.

The following example demonstrates a call to Group 1. Group 1 corresponds to the created Multigroup 1 with the a list of radios -95 (**IP address** = 12.0.0.95) and 404 (**IP address** = 12.0.1.148). The radio with the **IP address** = 12.0.1.148 (**ID** = 404) initiates a group call. The radio with the **IP address** = 12.0.0.95 (**ID** = 95) is also able to participate in the call due to Multigroup 1.

User 1:

Client List

The **Client List** tab enables you to see the lists of client applications connected to the radioserver and to manage the settings of the users created to work with the web application.

To open the list of client applications connected to the radioserver, click the Client List tab and click Active.

🥸 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config							
Settings Networks Client List	Rules Activity Log Export/Import Settings Statistics						
All (mobile and web clients) O Active List of connected clients							
Client Name	Address Connect Time Profile						
Dispatcher - Administrator	192.168.37.75:51145	08.12.2015 9:55:37					
	192 169 27 75-51192	09 12 2015 9-56-25					

Client Name: Name of the desktop version of the dispatch console, the operator's name, or web application connected to the radioserver. If Windows Authentication is enabled in SmartPTT Dispatcher > Settings > General Settings, you can also see the name of the Windows group (which, in this case, corresponds to the name of the operator) and the name of the Windows user logged into Windows.

Address: The IP address of the client application.

Connect Time: Time of the last session.

Profile: Assigned profile to the dispatcher or to the user of the web application.

Note: To assign a profile to the dispatcher, click **Settings** > **Radioservers** in SmartPTT Dispatcher. For more information about profiles see <u>Profiles</u> in the Help document.

To connect the desktop version of the dispatch console to the radioserver, go to Settings > Radioservers in

SmartPTT Dispatcher and select the radioserver to which you want to be connected. At that, in the Client List tab of

SmartPTT Radioserver Configurator the connected dispatch console will show up.

How to connect the user of the web application to the radioserver, please check WebClient

Installation & Configuration for SmartPTT.

To open the list of users created to work with the mobile and web clients, click All (mobile and web clients).

💱 SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config							
Settings Networks Client List Rules	Activity Log Export/Import Settings Statistics						
 All (mobile and web clients) 	Active						
Add Delete							
Login	Parameters						
Michael							
Peter	Login Michael	Change password					
Maria	Profile						
	✓ Allow voice calls						

The Login list: The list of users of the SmartPTT web application.

To add new user, click the **Add** button. In the **Parameters** section specify the user name in the **Login** field and set the password by clicking the **Change password** button. The user name and password are case sensitive.

Profile: It contains the list of profiles created in SmartPTT Radioserver Configurator (see the Settings tab >

Profiles). Assigning a profile to the user is not obligatory, but enables you to limit the user's access to objects and to provide additional opportunities in the organization of calls between user and radio subscribers. For more information about profiles see <u>Profiles</u> in the Help document.

Allow voice calls: Select it to enable the user to make voice calls.

To edit the parameters of the existing user, click this user in the Login list, and edit the necessary fields in the

Parameters section.

To delete user, click this user in the **Login** list, and click the **Delete** button.

To save the changes, click the **Save** button in the bottom right corner of the SmartPTT Radioserver Configurator.

Rules

SmartPTT Radioserver allows you to set up rules to perform automatic actions (playback sounds, send messages, play predefined voice notifications) based on conditions specified in the **Rules** tab in SmartPTT Radioserver Configurator.

To set up rules, open the Rules tab in SmartPTT Radioserver Configurator.

Events on radios: Allows you to create rules related to subscriber radios.

Events on Dispatcher: Allows you to create rules related to SmartPTT Dispatcher.

To create a new rule for events on radios, click **Events on radios** and then click **Add**. To change the existing rule, click **Modify** or double-click on the rule name in the list of rules.

Rule	
Name: Active:	Rule 1
Direction: Event Type: Date:	 Equal to Incoming Equal to ARS Call Message
Additional Information: Control Station:	
Talkgroup: Subscriber:	
Status: Duration:	
Actions Play Sound:	
Send Message:	
	Example: 1-99, 150 Subscriber 5-10 Talkgroup 0 +
Start Voice Notification: Stop Current Voice Notification:	Notification 1
	Save Cancel

Name: Any name of the rule.

Active: If selected, the rule will be used in the system.

Under **Conditions** you can select criteria of the rule.

Condition name	Operation	Value
Direction	Equal to	Incoming, Outgoing

Condition name	Operation	Value
Event Type	Equal to, Not equal to	ARS, Call, Message, Telemetry,
		Alarm, Block
Date	Between	Period of time
Additional Information	Equal to, Contains	Any additional information, e. g.
		text messages, titles and
		description of tasks, participants
		of a group call.
Control Station	Equal to, Contains	Control station name
Talkgroup	Equal to, Contains	Talkgroup name
Subscriber	Equal to, Not equal to	Subscriber ID
Status	Equal to, Not equal to	One of system statuses of events
Duration	Equal to, Not equal to, Greater than, Greater	Duration of time (seconds)
	than or equal to, Less than, Less than or equal	
	to, Between	

To create a new rule for events on SmartPTT Dispatcher, click **Events on Dispatcher** and then click **Add**. To change the existing rule, click **Modify** or double-click on the rule name in the list of rules.

ule			
Name:	Rule 2		
Active:	\checkmark		
Conditions			
Connection to Radiosen	ver: Lost	→ Timeout (s): 10	×
Actions			
Play Sound:			
Send Message:	Message text		
		Example: 1 - 99, 150	Ţ
	Subscriber	1-5	
	Talkgroup		~
Start Voice Notification:	Notification 1		
Stop Current Voice Notification:	Any		
	Save	Cancel	

Connection to Radioserver: If *Lost* is selected, the system performs predefined actions when the connection between SmartPTT Radioserver and the last dispatch console is terminated. If *Restored* is selected, the system performs predefined actions when the first dispatch console connects SmartPTT Radioserver.

Timeout (s): Time period in seconds, after which the SmartPTT Radioserver performs actions defined under the **Actions** area.

Under Actions you can define actions, which the system will perform when the rule conditions are fulfilled:

- **Play Sound:** When selected, you can specify the path to the folder with the audio file to play, and select a subscriber or a talkgroup to whom you want it to be sent. Supported audio file formats are MP3, OGG, WAV.
- Send Message: When selected, you can type a text message, select recipients (subscribers or a talkgroup), and the Send Message to Initiator option.
- Start Voice Notification: When selected, you can specify the notification to play (to learn how to create a voice notification, see <u>Voice Notifications</u>). If the rule conditions were fulfilled at the moment when the operator

played a voice notification, the voice notification specified in the rule actions won't play. To avoid this, select **Stop Current Voice Notification**. You can also specify which notification must be stopped.

Activity

The **Activity** tab displays events that happen in the radio network. Mostly, it is used for debugging purposes, but it can be useful for system administrators as well.

To open Activity, click the Activity tab in SmartPTT Radioserver Configurator.

Settings Networks	S Client List Network Config	uration Rules	Activity	Log	Export/Import Settings	Statistics		
Auto Scroll							Clear Activity Log	
All Events	 Registration (ARS) Messages (TMS) 	Location	ns (Locatio ry (Tel)	n)	Calls (Call)	I	Radio ID	
Date/Time	Type System			Event				

There are six types of events logged:

- Registration,
- Messages,
- Locations,
- Telemetry,
- Calls,
- Other (includes connection or disconnection of slots or control stations),

You can enter the radio ID into the Radio ID field to view the events related to the particular subscriber.

You should select one or several of those chekboxes to view events in the list.

All events are listed in the table with the following columns:

- Date/Time: The date and time of the event,
- Type: The one of the listed types above,
- System: The network where event happened,
- Event: The brief description of the event and its status.

You can apply the following settings for the list of events:

• Auto Scroll: Select to make auto refresh of the list of events. When a new event will happen in the system, it will occur in the top of the list.

• Clear Activity Log: Click to remove all events from the table. Events will be kept in the log files, they would be

unavailable in the table of the Activity tab.

Example: sending GPS

Date and time in the regional format	Type of t	he event Sourse of the event	Informat	ion on the event					
Date/Time	Туре	System	Event

			Incomin	Initiator of the event g event	Description of the event	ID of the event initiator	Content of the event		Timestamp in the regional format

Network Configuration

In the **Network Configuration** tab you can set up elements of the networks used in the system. The added elements will be displayed in the **Topology** tab of SmartPTT Dispatcher. You can also set up sending of alarm notifications to predefined addresses.

SmartPTT Server Configuration - C:\Program Files (x86)\SmartPTT\Server\RadioService.exe.config							
Settings Networks Client List Network Configuration Rules Activity Log Export/Import Settings Statistics							
Radioserver	Network Monitoring						
NAI Systems	Network Alam Notifications						
London	Update Topology Expand All Collapse All						
UPS	NAI - IP Site Connect 170						
- E Router	🚊 - London						
	SmartPTT Radioserver						
	UPS III III						
	I Router						

Note: This tab is available only if there is a license for monitoring. If you have it, make sure you have selected the **Active** check box in the <u>Monitoring</u> window.

To add elements of the network, select the network in the list. The supported network elements include: repeaters,

routers, UPS and location. To add devices, open the context menu by right-clicking on the existing network.

Radioservers are added automatically with the name Server.

To delete the created object, right-click on the object and then click **Remove Repeater**, **Remove Device** or **Remove Location** respectively.

Adding Repeater

To add a repeater, click **Add Repeater** in the context menu. At that, the window for setting up repeater parameters will open.

Settings Networks Client List Network Con	figuration Rules Activity	/ Log Export/Import Settings Statistics
Radioserver Connect Plus NAI Systems NAI - IP Site Connect 170 London VPS WPS Router Repeater 2	Repeater General Alam Notificat Peer ID Name Description	tions 2 Repeater 2 Repeater 2
	SNMP Parameters	Community 1

- Peer ID: Unique identifier of the repeater.
- **Name:** Any random name of the repeater. The name will be used in the **Topology** tab in SmartPTT Dispatcher. If the name is not set, the name from the repeater codeplug will be displayed.
- Description: Random description of the repeater.
- **SNMP Parameters:** Here you can set up the community name, which is used as a password for the external SNMP client to connect to the repeater.
 - o Active: Enable/Disable the external SNMP client.
 - **Community:** Community name used as a password for the external SNMP client to connect to the repeater.

In the Alarm Notifications tab you can set up automatic notification of alarms or errors occurred in the repeater.

You can have the notifications sent to your email address, to your cell phone, to an SNMP client or to radio subscribers.

Adding UPS and Routers and other devices

The supported devices include a router and an uninterruptible power supply (UPS). To add a device, click **Add Device** in the context menu. At that, the following window will open.

🎯 SmartPTT Server Configuration - C:\Prog	ram Files (x86)\SmartPTT\	Server\RadioService.exe.config	
Settings Networks Client List Network Conf	iguration Rules Activity	Log Export/Import Settings Statistics	
Radioserver Connect Plus NAI Systems NAI - IP Site Connect 170 NAI - IP Site Connect 170 NAI - IP Site Connect 170 With Condon With SmattPTT Radioserver WPS Router	Device General Alam Notification Type Name Description	Cisco 2900 Router	
	Interface IP-address SNMP Version Community Response Timeout, s Polling Interval, s	192.168.37.85 Port 162 192.168.37.86 Port 161 V1 Community 2 3 30	
	Check Connect SNMP Parameters Active External Community	tion Ext_Community 2	

- **Type:** Device type. There are the following devices to choose from:
 - Cisco2900 (router)
 - Eaton9130 (UPS)
 - Huawei Router
 - UPS ATS-Convers
 - Supermicro Server. This server allows you to receive information about the state of the radioserver and errors occurred on the radioserver. To be able to receive alarms from the radioserver, add Supermicro Server. If there are any alarms on the radioserver, you will see them in Monitoring event log in SmartPTT Dispatcher.
 - Apc 5000
 - Unknown (for other devices not specified in the list)
- Name: Random name of the device which is displayed in **Topology** in SmartPTT Dispatcher.

- **Description:** Random description of the device.
- Interface: The radioserver IP address used for interacting with the device.
- **IP-address:** IP address of the device.
- **SNMP Version:** Version of SNMP protocol used in the system. There are two options: versions 1 and 2 (V1 and V2).
- Community: Community name, which is used as password to locally connect to the device over SNMP protocol.
- **Response Timeout, s:** Time during which the server expects a response from the device. The maximum value is *10* sec.
- **Polling Interval, s:** Time period at the end of which the radioserver sends a request to the device. The default value is *30* sec.
- **Check Connection:** Checks if there is a connection to the device. At clicking the button a new window with the information on the connection status opens.
- SNMP Parameters:
 - Active: Enable/Disable the external SNMP client.
 - External Community: Special community name which is used as password to connect to the device via external SNMP client.

To set up the automatic alarm notifications from the device, go to the Alarm Notifications tab.

Adding Location

If there are many repeaters and devices, they can be grouped by location. In LCP systems a location represents a site (you can define **Site ID**). In Connect Plus systems a location can be used for added XRC controller. To add a location, select the **Add Location** option in the context menu. At that, the following window will open.

SmartPTT Server Configuration - C:\Prog	ram Files (x86)\S	martPTT\Se	erver\f	RadioService.exe.config) Statistics	
Radioserver	Location	Activity	.og	Export/import Settings	Statistics	
NAI Systems	Name		Londo	n		
SmartPTT Radioserver	Description		Londo	n		
	Initial State		🔳 Un	fold		

- Name: Any random name of the location. The name is displayed in the **Topology** tab in SmartPTT Dispatcher.
- Description random description of the location which is displayed in the Topology tab in SmartPTT
 Dispatcher when hovering the mouse pointer over the object.
- Initial State defines how the location object is to be displayed in the Topology tab in SmartPTT Dispatcher.
 If the check box is selected, all the devices and repeaters allocated to the location will be displayed by default.
 If the check box is not selected, the devices won't be seen inside the location by default. In this case, to see the devices, you will need to click on the location object in the Topology tab.

To add or remove a device or repeater from the location, simply drag it to another place.

Note: When deleting a location with devices and repeaters allocated to it, all the devices will be deleted together with the location.

You can upload the network elements, instead of adding them manually. To do it, click **Update Topology**. At that, a pop-up window will open and the update process will start:

🖳 Торо	logy Upd	late		
		Updating: 2/3		Stop
Changes		Remove missing peers	🔽 Up	odate names
Site	Peer ID	Change Type		
0	5	SmartPTT added		Cancel
0	1002	Name change Repeater Tomsk 1->Repeater 1		Cancel
		Cancel A		ОК

- **Stop:** Interrupts the ongoing update process. All the changes that were made prior interruption—these you can see in the **Changes** table—will be applied after clicking **OK**.
- Remove missing peers: Checks if there are any missing peers to exclude them from network topology.
- Update names: Replaces names of repeaters by those defined in CPS.

The **Changes** table shows all the changes made during the update process. You can discard changes by clicking **Cancel**. To discard all changes, click **Cancel All**. To apply the changes, click **OK**.

Alarm Notifications

SmartPTT can notify radio and telephone subscribers, and other users about errors or other malfunctions occurred on devices used in the system or occurred during the redudnancy.

To set up automatic radioserver redundancy error notifications, in the left list of the **Network Configuration** tab click **Radioserver** (here your radioserver name is displayed) and create the list of notifications receivers.

Settings Networks Client List Network Config	guration Rules Acti	vity Log Export/Impo	ort Settings Statistics	
Connect Plus	Radioserver			
	Redundancy error m	essages		
	Receivers		Add	Remove
	Туре	Receiver		
	Email	test@gmail.com		
	SMS	+71234567890		
	Message (talkgro	NAI - IP Site Connect 170) - Slot 1; Group 1	
	Message (radio s	1-50, 78		
	SNMP	0.0.0.0:162;V1;Communit	y1	

To do it, click **Add**. There are several types of receivers: individual radio subscribers, talkgroups, telephone subscribers, email users, SNMP clients.

To set up automatic alarm notifications, click **Alarm Notifications** in the **Network Monitoring** window:

SmartPTT Server Configuration - C:\Prog	ram Files (x86)\SmartPTT\Server\RadioService.exe.config
Settings Networks Client List Network Con	figuration Rules Activity Log Export/Import Settings Statistics
Radioserver Connect Plus NAI Systems I London UPS Router	Network Monitoring Network Alam Notifications Alams Select All Image: TxAlam Image: TxAlam Image: TxAlam Image: TxAlam Image: TempAlam Image: TempAlam Image: TempAlam Image: TempAlam
	Receivers Add Remove
	Type Receiver
	Email testemail@mail.com
	SMS +441234567890
	SNMP 186.168.45.26:162;V1;public
	Message (radio s 89, 2525, 4001-4005
	Message (talkgro IP Site Connect_170 - Slot 2_170; Group1

Select all the alarms you want to be notified about. Then create the list of notifications receivers. To do it, click **Add**. There are several types of receivers: individual radio subscribers, talkgroups, telephone subscribers, email users, SNMP clients.

The alarm notifications set in the **Network Monitoring** tab are applied to all elements of the radio network, but you can change them for each element of the network.

Log

The Log tab was designed to give information about the radio service system events. Mostly it is used for debugging

purposes.

To see the log of the radio service, open the Log tab.

Export/Import Settings

SmartPTT Radioserver allows exporting configuration settings and database from one radioserver and importing them into another. Thus, the process of setting up new radioserver(s) with similar configuration settings becomes much easier and quicker.

How to Export or Import Settings

To export or import the radioserver settings or/and the database, click Export/Import Settings.

ttings Networks	Client List	Rules	Activity	Log	Export/Import Settings	Statistics		
Export								
Save Export File /	ls:							
								Browse
Settings								
Export Radio	server Datab	ase						
Export								
Import								
Import Choose File to Imp	port:							
Import Choose File to Imp	port:							Browse
Import Choose File to Imp Settings	port:							Browse
Import Choose File to Imp Settings	port:	base						Browse
Import Choose File to Imp Settings Import Radi Override Settir	port: poserver Datal	base						Browse
Import Choose File to Imp Settings Import Radi Override Settir © Keep Se	port: pserver Datal gs rver GUID	base						Browse
Import Choose File to Imp Settings Import Radi Override Settir	port: pserver Datal gs rver GUID	base						Browse
Import Choose File to Imp Settings Import Radi Override Settir © Keep Se © All	port: pserver Datal gs rver GUID	base						Browse

Note: Before exporting or importing the radioserver configuration settings and the database, stop the server. Otherwise, the buttons **Browse**, **Export** and **Import** will be unavailable.

Exporting the Settings and/or the Database

To export the settings and/or the database of the radioserver, take the following steps:

- 1. Stop the radioserver.
- Select the file where you want the settings to be exported by entering the path to the file in the Save
 Export File As field or by clicking Browse.

- 3. Select Export Radioserver Database if you want the database to be exported too.
- 4. Click **Export**.

Note: You cannot export the radioserver database separately, i.e., without the settings.

Importing the Settings and/or the Database

To import the settings and/or the database to the radioserver, take the following steps:

- 1. Stop the radioserver.
- Select the file from where you want the settings to be imported by entering the path to the file in the Choose File to Import field or by clicking Browse.
- 3. Select Import Radioserver Database if you want the database to be imported too.
- 4. Select the import mode:
 - Keep Server GUID: Import mode when the server globally unique ID is left unchanged. After importing, there are two servers with same configuration settings, but different globally unique GUID's.
 - 2) All: Import mode when all the server configuration settings, including the GUID, are replaced with the imported values. After importing, there are two servers with absolutely identical settings and GUID's.
- 5. Click Import.

Note: After importing the radioserver settings with the option to override all the existing settings (**AII**), it is important to delete one of the two servers to avoid GUID conflict.

Statistics

The **Statistics** tab demonstrates you the following information:

- The total number of events on the radioserver (the Events field).
- The space on the hard drive used by the databases (the Database field).
- The space on the hard drive used by the audio records (the Audio field).

etting	gs Networks Client List	Network Configuratior	n Rules /	Activity Log	Export/Import S	
Ever	nts					/
Reg	gistration	0				
Call	s	0				
Mes	ssages	0				
Tele	emetry	0				
Alar	ms	0				
Data	abase					
	Name	Current Size	Max Size			
•	Radio Server Database.md	2.3 Mb	4.00 Gb			
	Monitoring.mdf	3.3 Mb	4.00 Gb			

When the total size of records in your database exceeds 90% of the maximal size, a message will appear:

From this message you can learn the size of the records in your database. This message will appear at the every start of SmartPTT Radioserver Configurator. Then, if database is not cleaned up, it will appear every 30 min.

When the total size of records in your database reaches its maximum, another message will appear:

This message will appear at the every start of SmartPTT Radioserver Configurator. Then, if database is not cleaned up, it will appear every 30 min.

Note: In rare cases you may see the message that database is 100.00% full. It actually means that database is 99.995% full.

Input Sound Configuration Utility

Introduction

Input Sound Configuration Utility is a program that changes the parameters of the voice which transmits to the SmartPTT Radioserver from the control station. Applying various filters you can enhance the quality of the voice. It is not a service, so you do not need to keep this program active while SmartPTT Radioserver is running.

Installation procedure

The program installs with the SmartPTT Radioserver. You do not need to make any actions to assist this process.

Running the program

To run the program:

- 1. Go to the folder where SmartPTT Radioserver is installed (typically, it is C:\Program Files \SmartPTT\Server\ or C:\Program Files (x86)\SmartPTT\Server\).
- 2. Open the **ServerSoundConfigurator** folder.
- 3. Run the ServerSoundConfigurator.exe file.
- ×

You may add the program shortcut to your workplace if needed.

Using the program

Linking to the SmartPTT Radioserver

You should link Input Sound Configuration Utility to the SmartPTT Radioserver only at the first start of the program.

To link Input Sound Configuration Utility to the SmartPTT Radioserver:

- 1. Run ServerSoundConfigurator.exe.
- 2. Click the **Browse** button to point the path to the SmartPTT Radioserver folder.

입 이 아이 아	ty	
Server setup folder	Click to point the path to the server folder	
Apply settings on-the-fly	Click to point the path to the server lolder	

3. Select **Apply settings on-the-fly** to apply changes immediately after you make them.

Note

If you unselect this, you should click **Save** to apply changes.

Linking to the SmartPTT Radioserver is complete.

Adding the control station

To link Input Sound Configuration Utility to the control station:

- 1. Run ServerSoundConfigurator.exe.
- 2. Make sure that SmartPTT Radioserver is linked.
- 3. In the **Pipelines** area click **Add** to add a template for the control station.

Plip Input Sound Configuration Utility
Server setup folder Browse C:\Program Files (x86)\SmartPTT\Server Apply settings on-the-fly Click to delete a template
Pipelines CS name Del
Highpass Lowpass EQ band Notch HighShelf LowShelf Bandpass Click to add a new template
Add 🗸
Save
Click to apply changes

- 4. Copy the name of the control station from the **Name** field of the "SmartPTT Server Configuration" program.
- 5. In the **CS name** field paste the name of the control station copied from SmartPTT Radioserver Configurator.

Settings Networks Client List F	ules Activity Log E	xport/Import Settings Statistics	
Control Stations Control Station My Control Station Channels Control Station Audio Control Station Co	Analog Control Stat	tion My Control Station	Copy the name of the control station from there
Al Systems Capacity Max Networks SIP/RTP Interfaces SmartPTT Radioservers	CS name My Cont Highpass Lowpas	rol Station s) EQ band Notch HighShel	f LowShelf Bandpass
	Serial Port Switch Pin	COM1 • CD (1) •	Paste the name of the control station there
	Rx Pin	CTS (8) 👻	
	Tx Pin	RTS (7) 🔹	
	TX Time-Out Timer, s		60
	Analog Call Hangtime	ms	3000

6. Click **Save** if **Apply settings on-the-fly** is unselected.

Warning

You should create no more than one template for each control station.

Linking to the control station is done.

Working with filters

Filter types

You can add seven types of filters to enhance the sound:

• <u>Highpass</u>: Click to mute all frequencies which are lower than the particular one.

• Lowpass: Click to mute all frequencies which are higher than the particular one.

• <u>EQ band</u>: Click to amplify or attenuate particular range of frequencies.

• <u>Notch</u>: Click to mute the particular frequency.

• <u>HighShelf</u>: Click to amplify all frequencies which are higher that the particular one.

• LowShelf: Click to add a minimum frequency of the range to be attenuated.

• <u>Bandpass</u>: Click to add a filter with a narrow passing band.

Warning

Try to avoid the possible intersection of filters with opposite effects.

To select a proper set of filters, please, refer to the technical documentation on your radios and control stations.

Adding filters

Adding Highpass

To add a highpass filter:

1. Click **Highpass** in the control station template. A new line will appear.

ពុំរុំទ Input Sc	ound Configuration Utility
Server setu BrowseC:	up folder Program Files (x86)\SmartPTT\Server
Pipelines	Type the minimum frequency
CS name	My Control Station Del
Highpass	Freq, Hz 440
Highpass	Lowpass EQ band Notch HighShelf LowShelf Bandpass
	Click to add highpass filter Click to delete filter

- 2. Type the minimum frequency (measured in hertz) in the **Freq, Hz** field.
- 3. Click Save if Apply settings on-the-fly is unselected.

You should apply only one **Highpass** filter for each control station.

Adding Lowpass

To add a lowpass filter:

1. Click **Lowpass** in the control station template. A new line will appear.

ពុំដុំ Input So	und Configuration Utility
Server setu	p folder
Browse C:\	Program Files (x86)\SmartPTT\Server
Pipelines -	Type the maximum frequency
CS name	My Control Station Del
Lowpass	Freq, Hz 440 Del
Highpass	Lowpass EQ band Notch HighShelf LowShelf Bandpass
	Click to add lowpass filter Click to delete filter

- 2. Type the maximum frequency (measured in hertz) in the **Freq**, **Hz** field.
- 3. Click **Save** if **Apply settings on-the-fly** is unselected.

You should apply only one **Lowpass** filter for each control station.

Adding EQBand

To add a gain filter:

1. Click **EQband** in the control station template. A new line will appear.

ให้ Input Sound Co	nfiguration Utility			
Server setup folder	r Filos (v86)\SmartDTT\Sonro	Type the ce	entral frequenc	y
Apply settings of	on-the-fly		Type the b	and width
Pipelines		/	/	Type the gain index

EQ band	Freq, Hz 440	Width, Hz 10	Gain, dB _2	Del
Highpass Lowpa	ess EQ band Notch High	Shelf LowShelf	Bandpass	
ck to add lowpass	filter		Click to delet	e filter

- 2. Type the required parameters:
 - **Freq, Hz**: Type the central frequency (measured in hertz) for the range you need to amplify or attenuate.
- Width, Hz: Type the width of a frequency band (measured in hertz) you need to amplify or attenuate.
- **Gain, dB**: Type the gain index (in decibells). You can type positive values to amplify the sound or negative values to attenuate the sound.

Information

If you type 2 in the Gain field, you will hear a twice-loud voice. If you type -3 in the Gain field you will hear a thrice-low voice.

3. Click **Save** if **Apply settings on-the-fly** is unselected.

You can apply multiple gain filters with different frequency ranges for each control station.

Adding Notch

To add a notch filter:

1. Click **Notch** in the control station template. A new line will appear.

ពុំរុំទ្ Input Sc	ound Configuration Utility	
Server setu BrowseC:\	up folder "Program Files (x86)\SmartPTT\Server ettings on-the-fly	
Pipelines		Type the central frequency

CS name	My Control Station	Del
HighShel	f Freq, Hz 440 Gain, dB -2	Del
Highpass	Lowpass EQ band Notch HighShelf LowShelf	Bandpass
Clic	k to add high-shelf filter	Click to delete filter

- 2. Type the required parameters:
- **Freq, Hz**: Type the border frequency for the range you want to amplify.
- **Gain, dB**: Type the gain index (measured in decibells) for the amplifying range.
- 3. Click **Save** if **Apply settings on-the-fly** is unselected.

Adding LowShelf

To add a low-shelf filter:

1. Click **LowShelf** in the control station template. A new line will appear.

til Input Sound Configuration Utility	
Server setup folder	
Browse C:\Program Files (x86)\SmartPTT\Server	horder fraguency
- Dipelines	border irequency
	Type the gain index
CS name My Control Station	Del
LowShelf Freq, Hz 440 Gain, dB -2	Del
Highpass Lowpass EQ band Notch HighShelf LowShelf	Bandpass
Click to add low-shelf filter	Click to delete filter

- 2. Type the required parameters:
- **Freq, Hz**: Type the border frequency for the range you want to attenuate.
- **Gain, dB**: Type the gain index (measured in decibells) for the attenuating range.
- 3. Click **Save** if **Apply settings on-the-fly** is unselected.

Adding Bandpass

To add a bandpass filter:

1. Click **Bandpass** in the control station template. A new line will appear.

Input Sound Configuration Utility Server setup folder Browse C:\Program Files (x86)\SmartPTT\Server	
Apply settings on-the-fly	
Pipelines I ype the frequency to	pass
CS name My Control Station	Del
Bandpass Freq, Hz 440	Del
Highpass Lowpass EQ band Notch HighShelf LowShelf Bandpass	
'/	/ "

- 2. Type the frequency you want filter to pass in the **Freq**, **Hz** field.
- 3. Click Save if Apply settings on-the-fly is unselected.

Reordering filters

To reorder filters in the template you should create another template with the right order of filters. You cannot change the order of filters in the current template.

Editing filters

To edit a filter:

- 1. Change values in the corresponding fields.
- 2. Click **Save** if **Apply settings on-the-fly** is unselected.

Deleting filter

To delete a filter:

- 1. Click **Del** next to the filter.
- 2. Click **Save** if **Apply settings on-the-fly** is unselected.
